PARTS LIST.....	.13

1. SAFETY PRECAUTIONS

WARNING: Service should not be attempted by anyone unfamiliar with the necessary precautions on this monitor.

The followings are the necessary precautions to be observed before servicing.

- 1) An isolation transformer must be used between the AC supply and the AC plug of the monitor before servicing or testing is performed since the chassis and the heat sink are directly connected to one side of the AC line which involves a shock hazard.
Before servicing is performed, read all the precautions labelled on the CRT and chassis.
- 2) Always discharge the picture tube anode to the CRT conductive coating before handling the picture tube.
The picture tube is highly evacuated and if broken glass fragments are violently expelled, use shatterproof goggles and keep picture tube away from the bare body while handling.
- 3) Potentials as high as 25Kvolts are present when this receiver is operating. Operation of the receiver outside the cabinet or with the back cover removed involves a shock hazard from the receiver.
 - a) Servicing should not be anyone who is not thoroughly familiar with the precautions necessary when working on high-voltage equipment.
 - b) Always discharge the picture tube anode to keep off the shock hazard before removing the anode cap.
 - c) Perfectly discharge the high potential of the picture tube before handling. The picture tube is highly evacuated and if broken glass fragments are violently expelled, use shatterproof goggles and keep picture tube away from the bare body while handling.
- 4) Wind the lead wires around terminals before soldering when replacing parts or circuit boards.
- 5) When replacing a high wattage resistor (oxide metal film resistor) in circuit board, keep the resistor 10mm always from circuit board.
- 6) Keep wires away from high voltage or high temperature components.

2. X-RAY RADIATION PRECAUTIONS

- 1) Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards the high voltage must not be above the specified limit. The nominal value of the high voltage of this receiver is 25Kv at zero beam current (minimum brightness) under a 120V AC power source. The high voltage must not, under any circumstances, exceed 30Kv. Each time a receiver requires servicing, the high voltage should be checked following the HIGH VOLTAGE CHECK procedure on page P (11) of this manual. It is recommended the reading of the high voltage be recorded as a part of the service record. It is important to use an accurate and reliable high voltage meter.

- 2) The only source of X-RAY RADIATION in this receiver is the picture tube. For continued X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.

3. PERFORMANCE AND OPERATING DATA

Apply a suitable power source to the monitor through an isolation transformer.

Set Up Controls

All controls are preset at the factory, but may be adjusted to suit program material.

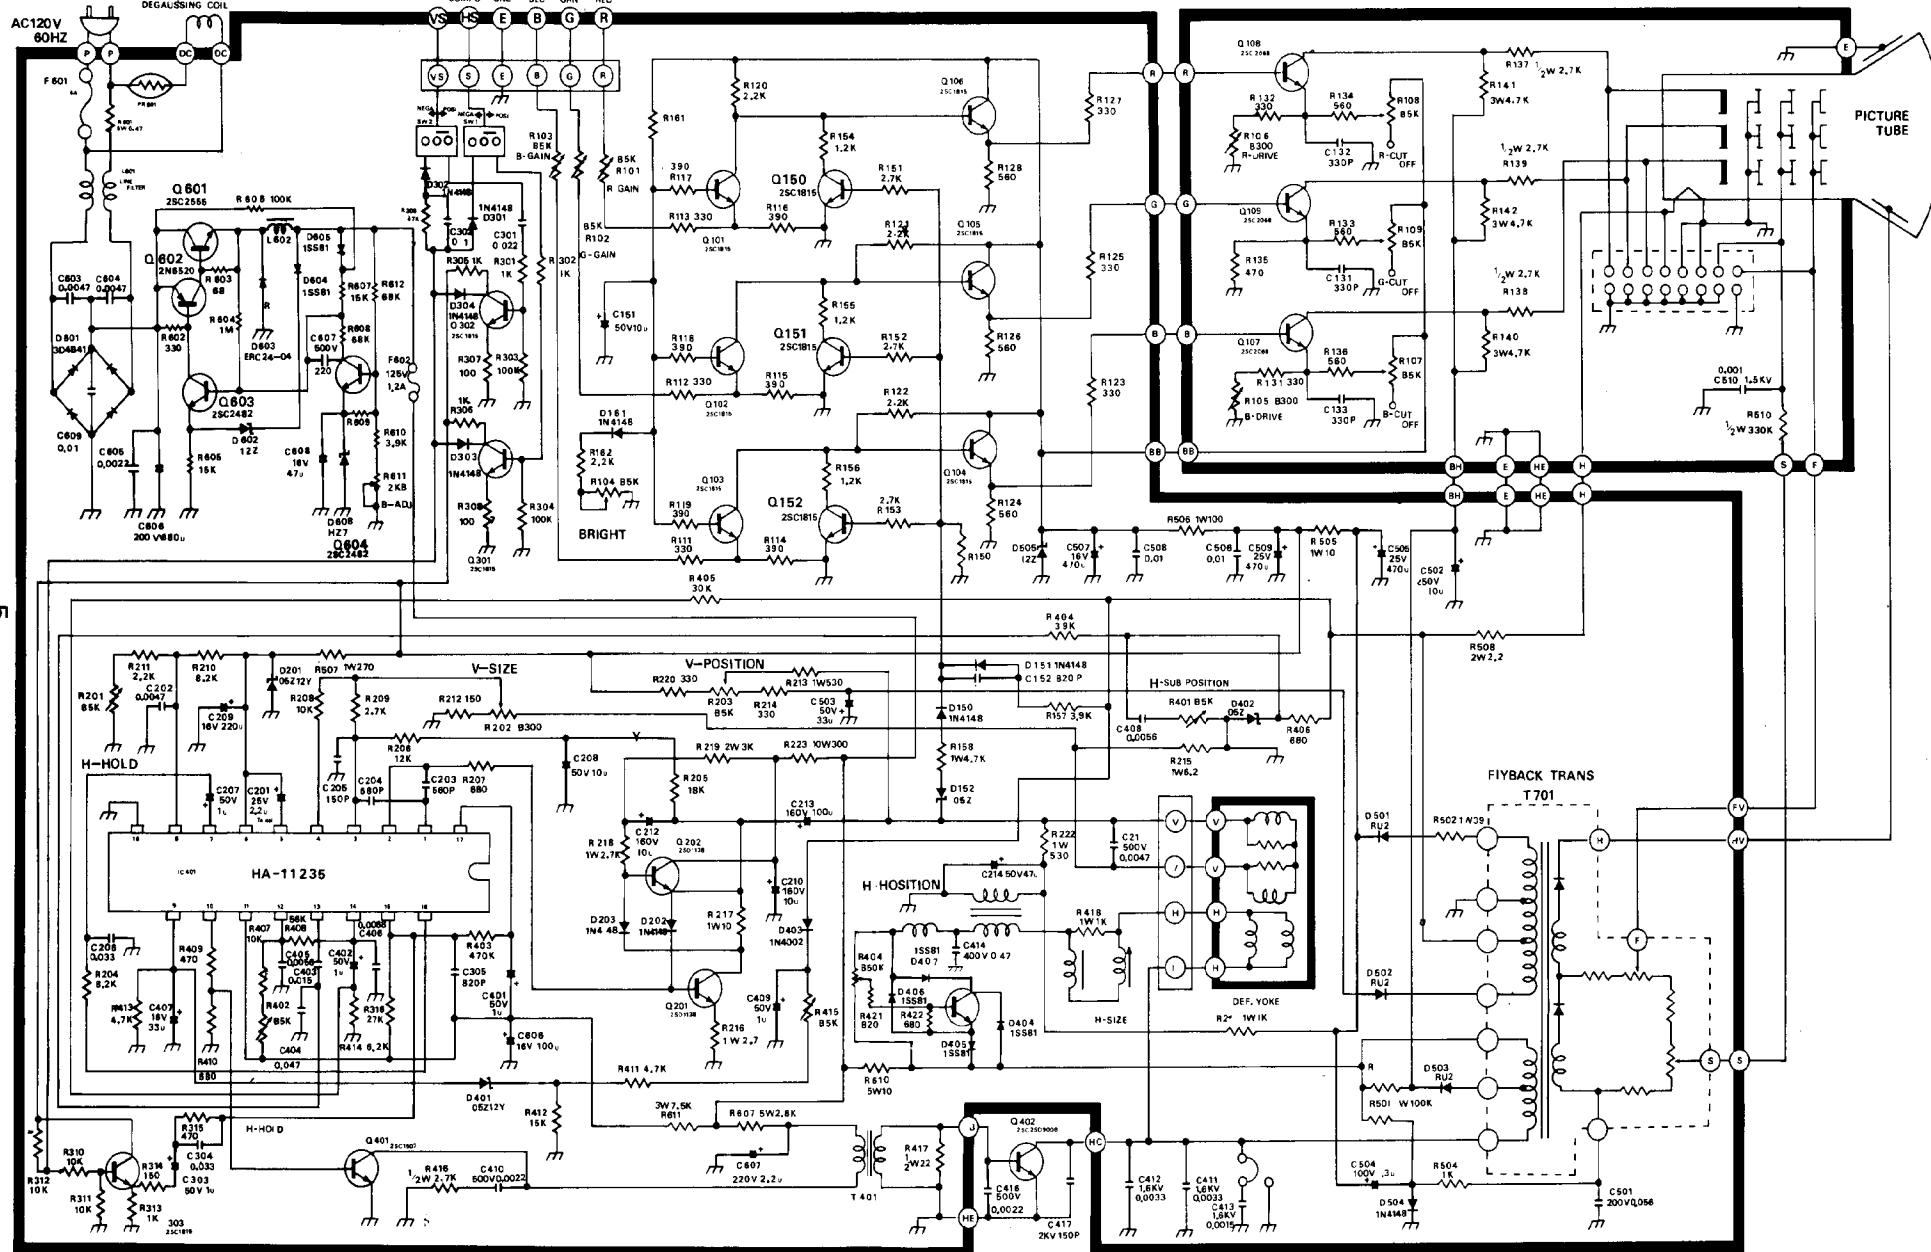

— Supply

Voltage 105VAC-132VAC

Frequency 50HZ-60HZ

(Apply supply voltage through an isolation transformer with 1 Amp. minimum capability.)

SCHEMATIC DIAGRAM

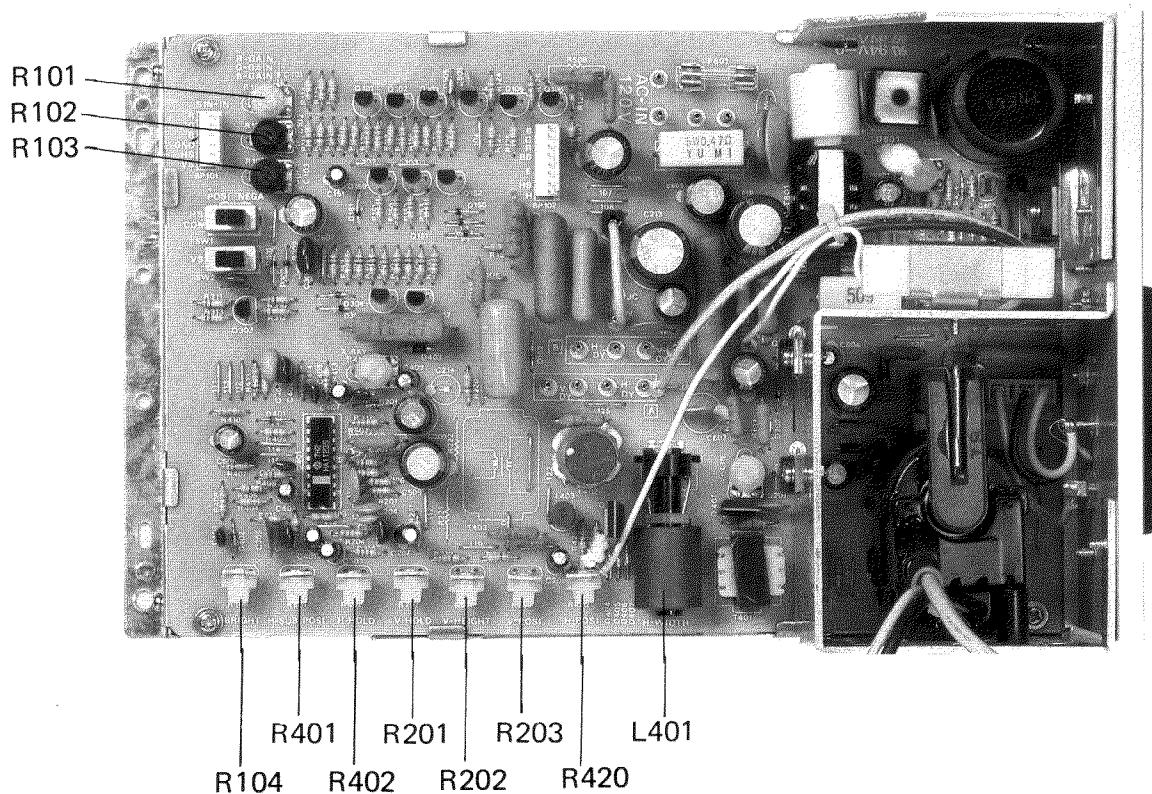

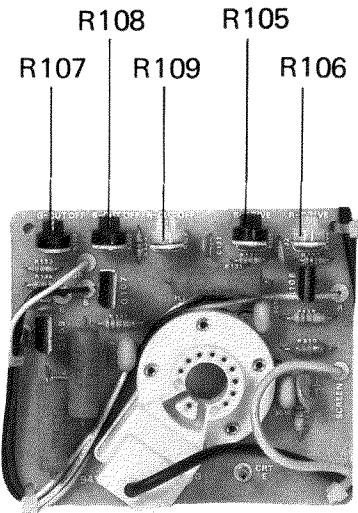

SERVICE INSTRUCTIONS

All monitors are equipped with automatic degaussing coils which demagnetize the picture tube every time the monitor is turned on after being off for a minimum of 5 minutes. Should any part of the chassis become magnetized it will be necessary to degauss the affected area with a manual degaussing coil. Move the coil slowly around the CRT face area and all surrounding metal parts. Then slowly withdraw for a distance of 6 feet before turning off.

CIRCUIT ADJUSTMENT

- 1) 117V Power Supply Adjustment (Adjust R 607)
- 2) Horizontal Oscillator Adjustment (Adjust R402)
If there is an indication of unstable horizontal synchronization, adjust the Horizontal Hold Control (R402) to produce a stable picture.
- 3) Width Adjustment(Adjust L401)
If the picture of the screen is not adequately wide, adjust L401 to the width as required.
- 4) Horizontal Raster Position Adjustment (Adjust R420)
If the picture is off center horizontally some compensation can be made by adjusting R420 as required.
- 5) Vertical Oscillator Adjustment (Adjust R201)
If the picture moves up or down on the screen, adjust the Vertical Hold Control (R201) until there is a single picture on the screen.
- 6) Vertical Height Adjustment (Adjust R202)
Adjust Height Control (R202) to change the height of the picture or pattern.
- 7) Vertical Raster Position Adjustment (Adjust R203)
If the picture or pattern is off center vertically some compensation can be made by adjustment (R203) as required.
- 8) White Balance Adjustment (Adjust R105, R108, R106, R107, R109.)
If raster is not appeared white level as no pattern, adjust R105 R106 R107, R108, R109 to best white level.
- 9) Focus Adjustment (Adjust Focus VR)
Adjust focus control VR on focus pack for well defined scanning lines in the central area of the screen.
- 10) Brightness Adjustment (Adjust R104)
Adjustment of R104 may be necessary to obtain the proper black level. Do not use the screen control to set the black level.
- 11) Screen Adjustment (Adust Screen VR on Focus Pack)
This control has been set at the factory and should not need further attention. If however it is necessary when the game is applied, adjust Screen VR on Focus Pack.

CONVERGENCE MAGNET ASSEMBLY POSITIONING

Convergence magnet assembly and rubber wedges need mechanical positioning following the figure 3.

COLOR PURITY ADJUSTMENT

NOTE: Before attempting any purity adjustments, the monitor should be operated for at least fifteen minutes.

- 1) Demagnetize the picture tube and cabinet using a degaussing coil.
- 2) Turn the BRIGHTNESS control to maximum.
- 3) Adjust RED and BLUE CUT controls (R108, R107) to provide only a green raster. Advance the GREEN CUT control (R109) is necessary.
- 4) Loosen the clamp screw holding the yoke, and slide the yoke backward to provide vertical green belt (zone) in the picture screen.
- 5) Remove the Rubber Wedges.
- 6) Rotate and spread the tabs of the purity magnet (see figure 4) around the neck of the picture tube until the green belt is in the center of the screen. At the same time, center the raster vertically.
- 7) Move the yoke slowly forward until a uniform green screen is obtained. Tighten the clamp screw of the yoke temporarily.
- 8) Check the purity of the RED and BLUE raster by adjusting the CUT controls.
- 9) Proceed with convergence adjustment.

CONVERGENCE ADJUSTMENT

NOTE: Before attempting any convergence adjustments, the monitor should be operated for at least fifteen minutes.

***CENTER CONVERGENCE ADJUSTMENT**

- 1) Receive crosshatch pattern with a R.G.B. signal generator.
- 2) Adjust the BRIGHTNESS control for well defined pattern.
- 3) Adjust two tabs of the 4-pole magnets to change the angle between them (See figure 4) and superimpose RED and BLUE vertical lines in the center area of the picture screen. (See figure 5).
- 4) Turn both tabs at the same time keeping the constant angle to superimpose RED and BLUE horizontal lines at the center of the screen.(See figure 5).
- 5) Adjust two tabs of 6-pole magnets to superimpose RED and BLUE line with

GREEN one. Adjusting the angle affects the vertical lines and rotating dot magnets affects the horizontal lines.

- 6) Repeat adjustments 3,4,5 keeping in mind RED, GREEN and BLUE movement, because 4-Pole magnets and 6-Pole magnets interact and make dot movement complex.

CIRCUMFERENCE CONVERGENCE ADJUSTMENT

NOTE: This adjustment requires Rubber Wedge Kit

- 1) Loosen the clamping screw of deflection yoke to allow the yoke to tilt.
- 2) Place a wedge as shown in figure 3 temporarily. (Do not remove cover paper on adhesive part of the wedge.)
- 3) Tilt front of the deflection yoke up or down to obtain better convergence in circumference. (See firgure 5) Push the mounted wedge into the space between picture tube and the yoke to hold to yoke temporarily.
- 4) Place other wedge into bottom space and remove the cover paper to stick.
- 5) Tilt front of the yoke right or left to obtain better convergence in circumference. (See figure 5).
- 6) Hold the yoke position and put another wedge in either upper space. Remove cover paper and stick the wedge on picture tube to hold the yoke.
- 7) Detach the temporarily mounted wedge and put it in another upper space. Stock it on picture tube to fix the yoke.
- 8) After placing three wedges, recheck overall convergence.
Tighten the screw firmly to hold the yoke tightly in place.
- 9) Stick3 adhesive tapes on wedges as shown in figure 3.
