AUDIO CARD	- WIRING DIAGRAM - COMPONENTS ARRANGEMENT

**PART I**

**INSTRUCTION MANUAL**

## I. INSTALLATION

Assemble the game as follows:

1. Bolt legs to the cabinet (use special bolts in coin box).
2. Gently extract electric cable and place it in the proper cavity, checking that non-skid knot is there.
3. Remove the elastic band that secures the light board and lift it to a vertical position. During this operation make sure that the cable is not crushed between the parts. The same care has to be used when disassembling so as not to squeeze the cables between the parts.

The light board has an automatic coupling that keeps it in a vertical position to ease the assembly of the 4 bolts. Always make sure that the automatic coupling is securely into operation. Open light board and fasten it to the cabinet with the 4 bolts and washers in the coinbox.

## VISUAL INSPECTIONS

On all games there are certain items that should be checked after shipment. These are visual inspections which may avoid some time consuming service work later. Minor troubles caused by abusive handling in shipment are unavoidable. Cable connectors may be loosened, switches (especially tilt switches) may go out of adjustment.

Plumb bob tilt switch should always be adjusted after game is set on location

1. Check that cabinet cable is connected to the light board cable.
2. Check for any wires that may have become disconnected.
3. Check that cables are clear of all moving parts.
4. Check that there are no tin residue or foreign material due to loose solder between contacts or on the connectors.
5. Check wires for proper soldering. Cold solder connections may not show up in the factory inspection, but vibrations in shipment may break contact.
6. Check that all fuses are making good contact.
7. Check wiring of transformer to correspond to location voltage.
8. Check and adjust tilt switches sensitivity as follows:
  - a. Plumb bob tilt switch (tilt 1)  
Adjust the length of plumb bob tilt according to desired sensitivity.
  - b. Rail tilt and ball (tilt 1)  
Insert ball in the guide, check that the ball rolls free closing contact when the cabinet is raised.
  - c. Shockproof tilt (tilt 2)  
There are 2:  
the 1st. near plumb bob tilt, the 2nd. near coin chutes.  
Adjust contact distance to desired sensitivity.

## **II. GENERALE GAME OPERATION**

1. Place ball into hole, plug in line cord.

Score displays are set to zero, display for max. score shows the highest score ever obtained (to obtain zero follow instructions, chapter V). « Credit » display shows remaining credits.

2. « Game over » light is lit. If « tilt » light is lit check the adjustment of tilt contacts which should be open.

3. Check that the machine properly accepts coins and advances corresponding credits (see chapter V).

Remember that the machine should not accept any coin when turned off or if the number of credits has reached the programmed max. (see chapter V).

4. If, after ignition, all displays were to alternate figures 6 and 9, it will be necessary to make some controls, since the data in storage memory, will be of no value. This is very likely to happen, if the machine was switched off for many weeks.

If, on the contrary, it has been recently used, and shows alternatively figures 6 and 9 it could well be that the battery or its input circuits are out of order.

When newly starting the machine re-programming will be necessary (see chapter V.).

5. Press « Credit » button - « GAME OVER » and possible « TILT » lights should be turned off.

- a. 1st player warning light should be lit.
- b. Lamp showing 1st player in game will light up.
- c. Credits will be decreased by one point.
- d. BALL TO PLAY lamp will have to be lit.
- e. Playfield is ready and the ball ejected from the hole.

6. Each new pressure on « Credit » button will decrease the bumper of credits and increase indication of numbers of players in game.

7. Maximum number of credits which can be required is 4.

## **GENERAL REMARKS ON THE GAME**

1. The number of balls to be played for each game is regulable (see chapter V).

2. The ball won during the game is immediately thrown in again.

3. The games won while playing for combinations accomplished or for achievement of winning scores are immediately awarded.

4. The games won by exceeding the maximum score (regulable) are awarded at the end of the game.

5. At the end of the game, the match lamp comes on (if programmed) and a game is awarded to each player having the last two figures of score equal to the match number. The games won are awarded only if the number of maximum credits (regulable) is not reached.

6. At the end of the game, the player (or players) who has got the superbonus win, is indicated by the winking of the corresponding lights.

**N.B.** This indication is of no value if the «SUPERBONUS» is programmed on «HIGHEST SCORE». In this case it will be shown on the displays.

7. When 3 balls are programmed per each game, dropping targets scores of top holes are increased.

8. If the score of any player exceeds 999.990, the last hand digit of the display will flash to indicate the over the top score.
9. When highest score is set on «Random» each time a new game is started a new and changeable score will be shown in the programmed range of scores (see test n° 21).

### **III. BOOK-KEEPING FUNCTIONS**

« Meter display » button is designed to help operators perform certain accounting fuctions such as the number of coins dropped and number of total plays.

The operator will know these data at any time.

For this purpose he will have to open the coin chute door and push the SELF TEST/METER/PROGRAMMING button.

1st. player display will show total coins in left coin chute.

2nd. player display will show total coins in right coin chute.

3rd. player display will show total coins in central coin chute.

4th. player display will show total plays.

Max. score display will show total replays.

Same data can be obtained using special print-out unit.

For this purpose, it will be necessary to connect the print-out to the special connector placed inside the cabinet on the right hand side.

Press « Stampa » button on the printer.

All displays and lamps will be turned off and a coupon will be printed as the sample below:

#### **FIRE MOUNT**

SERIAL N 0000

WINNED G 000006

PLAYED G 000013

COINS 1 000003

COINS 2 000002

COINS 3 000000

At the end of the printing the machine is ready for a new game.

In this model it has been foreseen the possibility of using an electromechanical scaler so that if the machine loses its programme no data of the bookeeping function for the coins or superbonuses will be lost.

This scaler should be applied to the printer service and will count coins value (weight) or how many «SUPERBONUSES» have been given.

To select one of the two possibilities, one should change the programming on test «21» as it follows:

To count how many coins have been inserted, programme test «21» on «00» if, on the contrary, one wishes to count «SUPERBONUSES», programme test «21» on «01» or «02» or «03». See, for example chapter V «PROGRAMMING» test 21.

#### **Ex. for COIN CALCULATIONS**

100 Lit. 1 impulse

200 Lit. 2 impulses

10 P. 1 impulse

50 P. 5 impulses

#### **Ex. for SUPERBONUS CALCULATIONS**

EACH TIME THE HIGHEST SCORE «RANDOM» IS OBTAINED ONE IMPULSE IS COUNTED ON THE SCALER (to have a correct accounting function see instruction «Chapter V» ).

To avoid that operators or other extract the scaler, thus making impossible to count coins and Superbonuses put a seal on the connector.

## **IV. GAME ADJUSTMENT**

Once the machine has been set up, it is ready to play.

It is, however, advisable to carry out a general inspection in order to make sure that all parts work correctly.

For this purpose there is a « self test » program which is activated each time the « SELF TEST/METER/PROGRAMMING » button is pressed.

### **TEST THEORY OF OPERATION**

1. Press button once.

« Match » display will show test number (01).

This test verifies book-keeping functions as in chapter III.

2. Press button again.

« Match » display will show test number (02). This test checks all displays.

Automatically the digit displays will go from 0, 1, 2 etc. to 9 and repeat continuously. Use this test to check if some digit segments have been damaged.

3. Press button again.

« Match » display will show test number (03). This test checks that all contacts are correct.

For this purpose it will be necessary to manually close all playfield contacts and those of the cabinet one at the time. Refer to the following list to check that the closed contact number is on « Credit » display.

### **CABINET CONTACT LIST**

- 00 Meter display button
- 01 Plumb bob tilt «ROLL BALL»
- 02 Shock proof tilt «SLAM TILT»
- 03 Credit button
- 04 Coin chute 1 (left hand side)
- 05 Coin chute 2 (right hand side)
- 06 Coin chute 3 (centre)
- 14 Reset highest score button

### **PLAYFIELD - CONTACT LIST (see table 2)**

- |                                       |                                       |
|---------------------------------------|---------------------------------------|
| 16 Bottom hole                        | 32 Center bumper                      |
| 17 Left hand kicker                   | 33 Top left hand contact              |
| 18 Right hand kicker                  | 34 Top right hand contact             |
| 19 Bottom inside right hand rollover  | 35 Left hand spinning target          |
| 20 Bottom outside right hand rollover | 36 Outside lateral contacts           |
| 21 Bottom outside left hand rollover  | 37 Right and spinning target          |
| 22 Bottom inside left hand rollover   | 38 Back target bank contacts          |
| 23 Top left hand hole:                | 39 Single moving target               |
| 24 Right hand bumper                  | 40 1st. left hand bank moving target  |
| 25 Top left hand rollover             | 41 2nd. left hand bank moving target  |
| 26 Top centre rollover                | 42 3rd. left hand bank moving target  |
| 27 Top right hand rollover            | 43 4th. left hand bank moving target  |
| 28 Top left hand fixed target         | 44 5th. right hand bank moving target |
| 29 Top right hand fixed target        | 45 6th. right hand bank moving target |
| 30 Left hand bumper                   | 46 7th. right hand bank moving target |
| 31 Top right hand hole                | 47 8th. right hand bank moving target |

4. Press button again.

« Match » display will show test number. (04).

This test checks that all pilot lamps are working properly.

All lamps except those fix will flash ON and OFF about 3 times per second.

5. Press button again.

« Match » display will show test number. (05).

This test checks all solenoids.

These are activated in sequences from 1 to 20 and corresponding number will be shown on « Credit » display.

#### **SOLENOID LIST (Table n° 4)**

- 01 Side holes
- 02 Moving target
- 03 Left hand target bank
- 04 Coin mechanism stop
- 05 Left hand kicker
- 06 Right hand kicker
- 07 Right hand target bank
- 08 Left hand bumper
- 09 Right hand bumper
- 10 Centre bumper
- 11 Outhole
- 12 Knocker
- 13 Coil 1
- 14 Coil 2
- 15 Coil 3
- 16 Coil 4
- 17 Coil 5
- 18 Coil 6
- 19 Coil 7
- 20 Coil 8

**N.B.** Flipper relay and gate are in this model piloted by two lamp exits.

Functional tests have now been completed.

Push again the "Self Test/Programming" push-button to set the pinball for a new game.

## **V. PROGRAMMING**

Games are factory programmed according to their destination. Programming elements may however be changed following procedure below.

It is assumed that such procedures will be left EXCLUSIVELY to technicians. Wrong programming could be the cause of malfunction. To verify or to change programming proceed as indicated in points 1 ÷ 24 excluding the setting to zero phase.

1. Open light board with game-up.

To have a total or partial re-programming, set memories to zero as it follows:

A) Press "Programming Enable" pushbutton placed on top left hand side of CPU BOARD.

B) Make a short circuit between TP19 and TP20, which are placed on bottom right hand side of CPU board; to do so one can use special tester push rod or isolated copper wire with peeled ends.

C) Proceed to the programming as indicated in points 2 ÷ 24.

2. Press "Programming Enable" button on the upper left hand side of CPU circuit.

3. Close light board without turning power off.
4. Press "SELF TEST/PROGRAMMING" button in coin chute.  
"Match" display will show test number (06). The number of balls per game can be programmed.  
Display «Credit» will show the programmed number. To change programme use «Credit» button. The number of balls can be changed from 0 to 7.

5. Press self test button.

«Match» display will show present test number (07).

«Match» can be programmed. Such possibility can be included or excluded by pressing «Credit» button.

#### CREDIT DISPLAY

- 00 excluded match.
- 01 included match.

6. Press «self test» button again.

«Match» display will show test number (08). Now the type of wins upon reaching winning score can be programmed.

(With wins programmed on superbonus, the number of credits is not increased but book-keeping function meters are equally up-dated).

Pressing «Credit» button, the following possibilities are available:

CREDIT DISPLAY — 00 SUPERBONUS

CREDIT DISPLAY — 01 ONE REPLAY

CREDIT DISPLAY — 02 BONUS BALL

7. Press «self-test» button.

«Match» display will show presente test number (09).

Max. number of replays can be programmed. «Credit» display shows present programmed number.

By pressing «credit» button programming is changed from 10 to 60.

8. Press «self test» button.

«Match» display will show the present test number (10).

Now it is possible to program the type of win awarded upon exceeding maximum score.

«Credit» button shows present programmed number.

Press «credit» button to change programming from 0 to 3.

- Display credit = 00 SUPERBONUS
- Display credit = 01 1 replay
- Display credit = 02 2 replays
- Display credit = 03 3 replays

9. Press «self test» button.

«Match» display will show test number (11).

The «weight» (value) of the coins accepted by coin chute 1 can be programmed (see table 1).

«Credit» display will show the present programmed value which can be changed by pressing «credit» button from 0 to 15.

10. Press «self test» button.

«Match» display will show number of test (12).

Number of additional credits can be programmed by introducing the coin into coin chute n° 1 (see figure 1). Go on as shown at point 9, to change programming from 0 to 15.

11. Press « self test » button.

« Match » display will show the test number (13).

The « weight » (value) of the coins accepted by coin chute 2 can be programmed (see figure 1). Go on as shown at point 9 to change programming from 0 to 15.

12. Press «self test» button.

»Match display will show test number (14).

Number for additional credits can be programmed by introducing the coin in coin chute n° 2. Go on as shown at point 9.

13. Press «self test» button.

«Match» display will show test number (15).

The «weight» (value) of the coins accepted by coin chute 3 can be programmed. Go on as shown at point 9.

14. Press «self test» button.

«Match» display will show test number (16).

The number of additional credits can be programmed by introducing the coin into coin chute n° 3. Go on as shown at point 9.

(see chapter VII: programming examples).

15. Press «Self test» button. «Match» display will show test number (17).

The first game variation can be programmed to light the word «ERUPTION» in order to reach the special:

- CREDIT DISPLAY = 00, normal game for 5 balls.
- CREDIT DISPLAY = 01, easy game for 3 balls. (double advancement).
- CREDIT DISPLAY = 02, easy game for 3 balls. (triple advancement).

16. Press «Self test» button again. «Match» display will show test number (18).

Second game variation can be programmed. By operating the credit button it is possible to select one of the following possibilities:

- CREDIT DISPLAY = 00, when hitting lit SPECIAL a SUPERBONUS is given.
- CREDIT DISPLAY = 01, when hitting lit SPECIAL a REPLAY is given.
- CREDIT DISPLAY = 02, when hitting lit SPECIAL a BONUS BALL is given.
- CREDIT DISPLAY = 03, when hitting lit SPECIAL 50.000. points are given.

17. Press «Self test» button again. «Match» display will show test number (19).

Third game variation can be programmed:

- CREDIT DISPLAY = 00, the SPECIAL of the right hand hole gives one BONUS BALL.
- CREDIT DISPLAY = 01, the SPECIAL of the right hand hole gives 50.000 points.

18. Press «Self Test» button. «Match» display will show test number (20).

Fourth game variation can be programmed. It relates to left hand rollover special. By operating the credit button it is possible to select one of the two following possibilities:

- CREDIT DISPLAY = 00, normal SPECIAL lighting.
- CREDIT DISPLAY = 01, easy SPECIAL lighting.

19. Press «Self Test» button. «Match» display will show test number (21).

Variation can be programmed on the max. score:

- CREDIT DISPLAY = 00, normal max. score and inserted coins accounting.
- CREDIT DISPLAY = 01, Random score from 600.000. to 1.700.000. makes low scores more frequent and counts SUPERBONUS.
- CREDIT DISPLAY = 02, as above makes medium scores more frequent and counts SUPERBONUS.
- CREDIT DISPLAY = 03, as above makes top scores more frequent and counts SUPERBONUS.

20. Press «Self test» button. «Match» display will show test number (22).

- On the «HIGHEST SCORE» display the max. score obtained is reported. Press the credit button if zero setting is desired.
21. Press «Self Test» button. «Match» display will show test number (23). «Credit» display shows 1st. winning score (hundred of thousands and tens of thousands).
  - To change it act on «Credit» button until the new wished score has been obtained.
  22. Press «Self test» button. «Match» display will show test number (24). «Credit display» shows 2nd. winning score (see point n° 21).
  23. Press «Self test» button. «Match» display will show the last test number (25). «Credit» display shows 3rd. winning score (see point n° 21).
  24. Press «Self Test» button.  
«Match» display will show the last test number (26). Displays show book-keeping functions (see chapter III). To clear meters press «credit» button. Press «Self Test» button again. The machine is now ready to play.
- N.B.** On tests number 23,24,25 one cannot programme a score higher than 990.000.  
**N.B.** The «Highest score reset» button placed on the coin mechanism shall be used to position the max. score at the desired level.  
Each time the button is pressed the score advances 100.000 points and when 1.900.000 is totalled, it starts again.

### **IMPORTANT INFORMATIONS TO PROGRAMME THE MACHINE WITH RANDOM SCORE AND CORRECT SUPERBONUS ACCOUNTING.**

To have a correct «Superbonuses» accounting, programme the machine as it follows:

1. «Match» programming has to be excluded (test 07 = 00).
2. The scores which can be programmed with tests 23,24,25 have to be at «Bonus Ball». Programme to zero tests 23,24,25 if «Bonus Ball» is not required.
3. The programme has to be «Superbonus» upon exceeding max. score (test 10 = 00)
4. The programme on Special Target has to be «Bonus Ball» or 50.000. points (test 18 = 02, or 03).
5. Test 21 has to be programmed on 01 or 02 or 03, one of the 3 score ranges to be used each time starts a new game.

— There is a melody each time «Random Score» is overcome. Book-keeping will record 1 point at the end of the game. (See chapter III - Book-keeping functions).

**N.B.** With two or more than two players only one «Superbonus» is awarded to the highest score, also indicated on «Highest score» display.

### **VI. ROUTINE MAINTENANCE ON LOCATION**

The purpose of this chapter is to give a general line to follow, so as to maintain the machine in proper operation.

The operations shown have to be carried out each time one operates on the machine, even when on power-up.

1. Follow first 5 tests as shown in chapter IV to check the correct operation of each flipper component.
2. Carefully check that securing screws of electronic boards do not work loose. Same  
— Check bumpers the rod.
3. Playfield (upper side)  
— Check and, if necessary, tighten the screws of the rubber post.

— Check the conditions of the rubber rings and, if necessary, change them. (remember to check the adjustment of contacts each time the rubber rings are replaced).

— Carefully clean playfield. Do no use highly caustic cleaners.

#### 4. Playfield (lower part).

— Check flipper assembly (tie rod, pin joints and contacts)

— Check bumpers

— Check contact adjustments.

— Check wiring harness to avoid tractions on the wires and obstacles to the moving parts.

#### 5. Check and adjust tilt sensitivity.

Remember: an effective periodic maintenance greatly improves flipper life time and avoids the possibility of damages.

## VII. GENERAL INFORMATION

The purpose of this instruction Manual is to help operators perform several simple procedures such as installation, maintenance, and game adjustments.

For more complicated problems more detailed procedures are available in the Technical Instruction Manual.

## COINS/CREDITS PROGRAMMING EXAMPLES

This game can be programmed for whatever combination of coins and credits. one has only to take into account the following data:

— The weight (value) of the coins can range from 0 to 15.

— The number of credits relevant to each coin can be changed from 0 to 15.

— Possible ratios of coin values:

a) 1-2-5 or

b) 2-5-10 or

c) 5-10-15 or has to be adapted to such ratio

Example n° 1:

1 DM = 2 credits

2 DM = 5 credits (1 x 2 DM or 2 x 1 DM)

5 DM = 14 credits (1 x 5 DM or 2 x 2 + 1 DM or 3 x 1 DM + 2 DM or 5 x 1 DM).

Programming:

Test 11 = 1

Test 12 = 2

Test 13 = 2

Test 14 = 5

Test 15 = 5

Test 16 = 14

In this case the coin chute n° 1 shall accept 1 DM coins and coin chute n° 2 shall accept 2 DM coins.

Coins chute n° 3, shall accept 5 DM coins.

Example n° 2:

1 FR = 1 credit

2 FR = 3 credits (2 x 1 FR) (1 credit allowance)

Programming:

Test 11 = 1

Test 12 = 1

Test 13 = 2  
Test 14 = 3  
Test 15 = 4  
Test 16 = 6

In this case coin chute n° 1 shall accept 1 FR coins. Coin chutes n° 2 and n° 3 are not provided.

Example n° 3:

1 FR = 0 credits  
2 FR = 1 credit (2 x 1 FR)  
5 FR = 3 credits (5 x 1 FR) (1 credit allowance).

Programming:

Test 11 = 1  
Test 12 = 0  
Test 13 = 2  
Test 14 = 1  
Test 15 = 5  
Test 16 = 3

It has to be pointed out that in this case coin chute n° 1 has to accept 1 FR coins and coin chutes n° 2 and n° 3 cannot be installed.

Example n° 4:

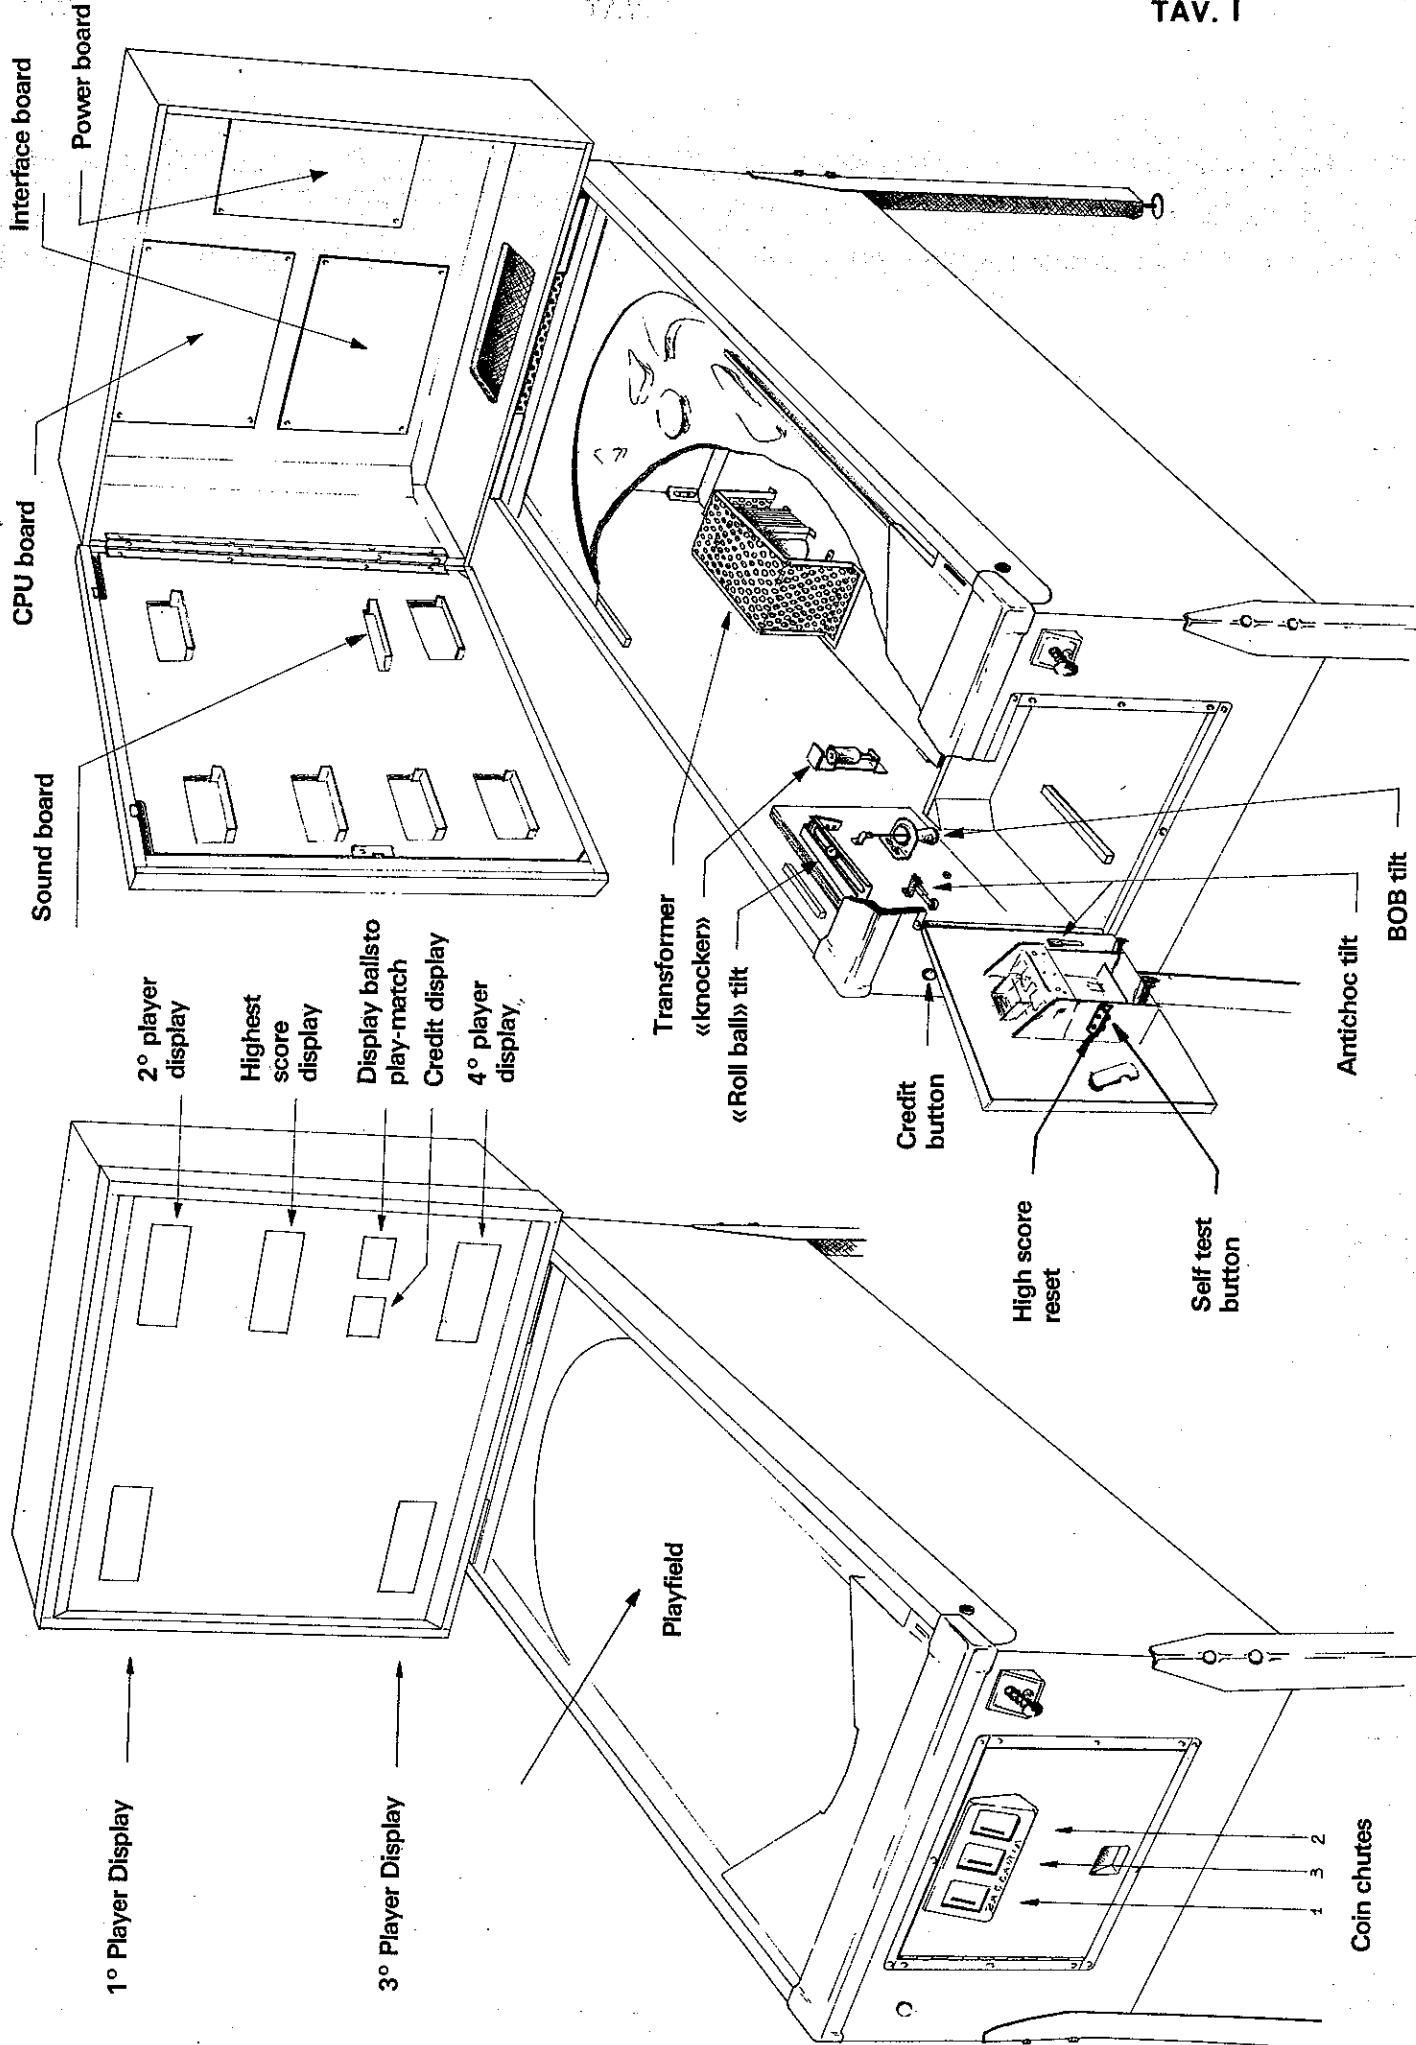

5 P = 1 credit (1 x 5 P)  
10 P = 2 credits (2 x 5 P or 1 x 10 P)

Programming:

Test 11 = 5 or 1  
Test 12 = 1 or 1  
Test 13 = 10 or 2  
Test 14 = 2 or 2  
Test 15 = 15 or 3

In this case the coin chute n° 1 shall accept 5 P coins - coin chute n° 2 shall accept 10 P coins.

**VERY IMPORTANT:** Position from 11 to 16 have always to be programmed regardless the number of installed coin chutes.

## CONTACT ARRANGEMENT

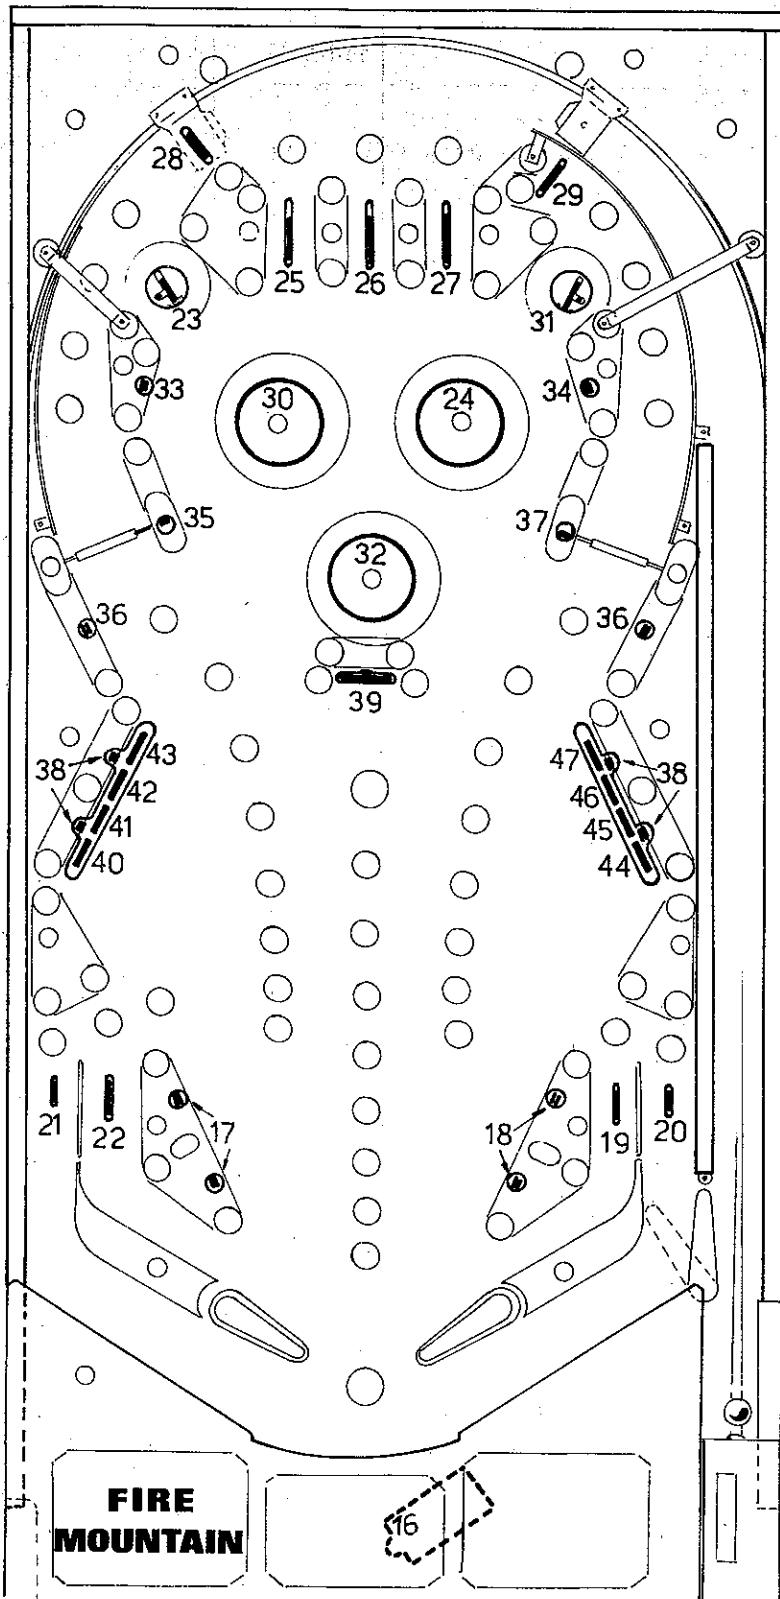

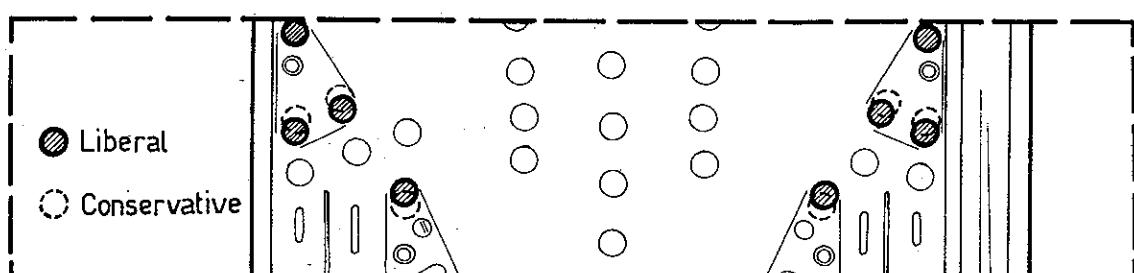

TABLE II

Contact Number	Description
16	Bottom hole
17	Left hand kicker
18	Right hand kicker
19	Bottom inside right rollover
20	Bottom outside right rollover
21	Bottom outside left rollover
22	Bottom inside left rollover
23	Top left hand hole
24	Right hand bumper
25	Top left hand rollover
26	Top centre rollover
27	Top right hand rollover
28	Top left hand fixed target
29	Top right hand fixed target
30	Left hand bumper
31	Top right hand hole
32	Centre bumper
33	Top left hand contact
34	Top right hand contact
35	Left hand spinning target
36	Outside lateral contacts.
37	Right hand spinning target
38	Back target bank contacts.
39	Single moving target
40	1st. left bank moving target.
41	2nd. left bank moving target.
42	3rd. left bank moving target.
43	4th. left bank moving target.
44	5th. right bank moving target.
45	6th. right bank moving target.
46	7th. right bank moving target.
47	8th. right bank moving target.

## LAMP ARRANGEMENT

- + Head lamps
- ++ Head and playfield lamps.

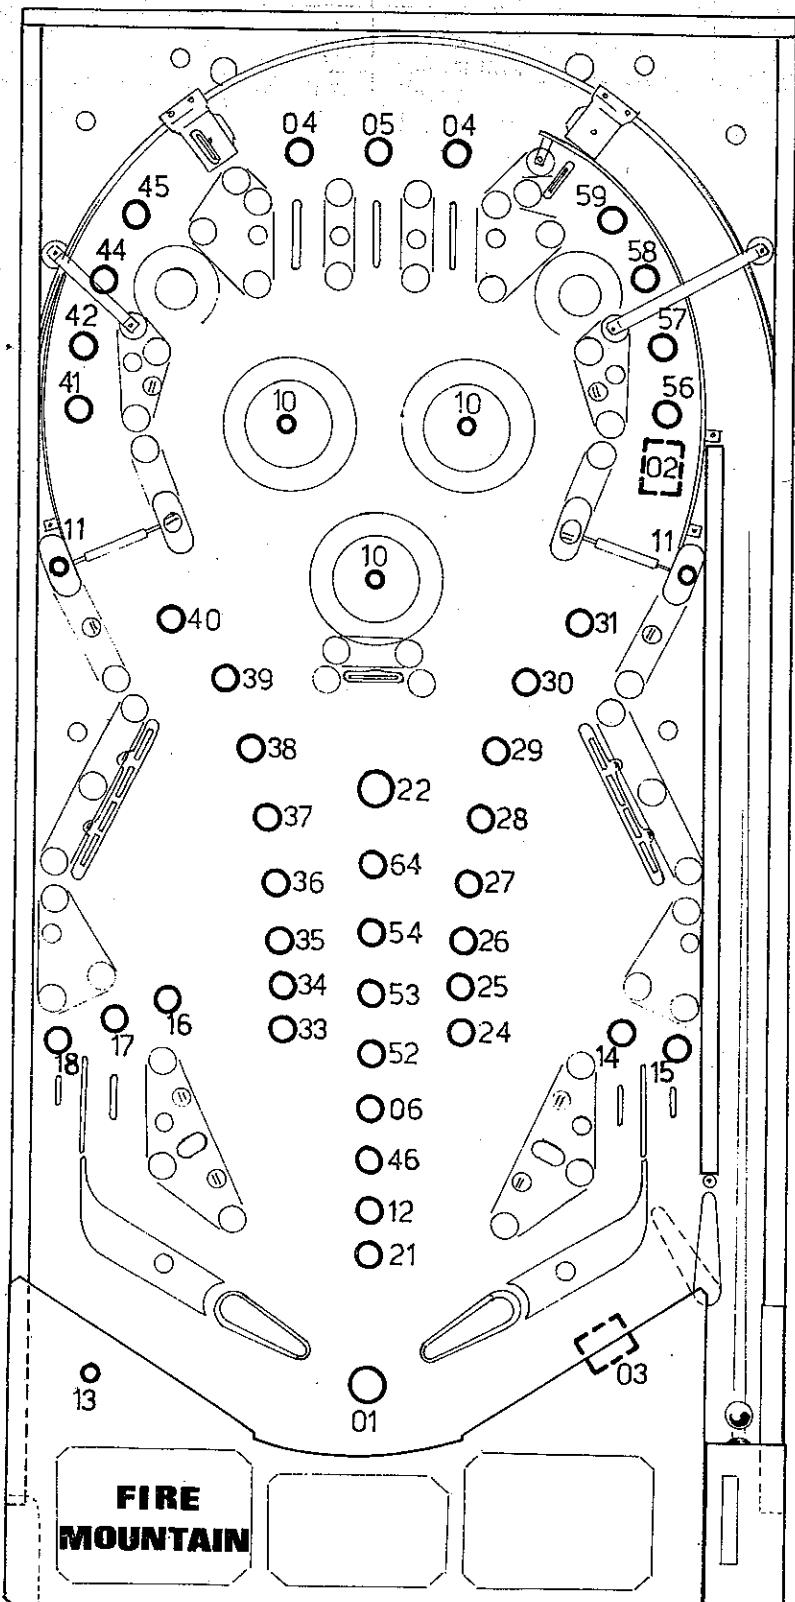

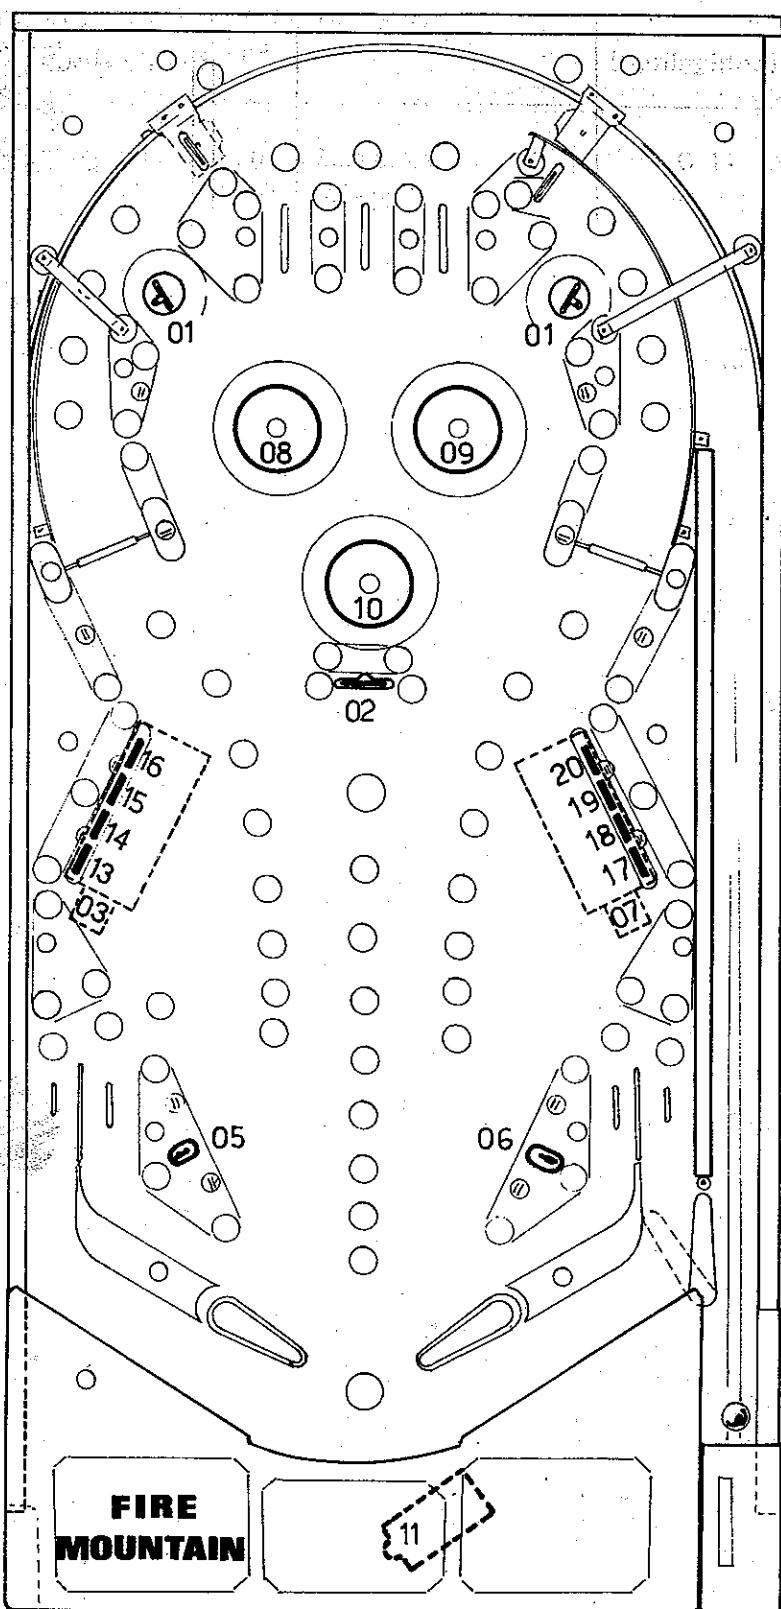

TABLE III

Lamp n°	Description	Driver n° (SCR)
+ 01	Bonus Ball	SCR 57
02	Flipper relay	SCR 61
03	Gate relay	SCR 62
04	Top side rollovers	SCR 54
05	Top centre rollover	SCR 55
06	"P" lamp	SCR 56
+ 07	Game over	SCR 59
+ 08	Match	SCR 58
09	Spare	SCR 53
10	Bumper lamps	SCR 64
11	Spinning target lamps	SCR 60
12	"R" Lamp	SCR 63
13	Credit	SCR 44
14	Bottom right rollover	SCR 43
15	Bottom right rollover	SCR 26
16	Bottom left rollover	SCR 25
17	Bottom left rollover	SCR 27
18	Bottom left special rollover	SCR 45
+ 19	Superbonus	SCR 51
20	Spare	SCR 36
21	"E" lamp	SCR 15
22	Special lamp	SCR 8
+ 23	Ball to play	SCR 42

**TECHNICAL INSTRUCTIONS**

## BLOCK DIAGRAM

## I. TROUBLESHOOTING

### LAMPS (insert test number 04)

POSITION	TEST NUMBER POSITION ON SWITCH	CONTROLLED LAMPS	
		ONE OR MORE LAMPS	ALL LAMPS
ALWAYS OFF	FIXED LAMPS	<ol style="list-style-type: none"> <li>Check fuse F7 on the feeder. (Fuses 15 AMP).</li> <li>Check for 7.5 Vac on feeder.</li> <li>Check for 7.5 Vac on feeder CN1 connector.</li> <li>Check mains fuse (near the transformer).</li> </ol>	<ol style="list-style-type: none"> <li>Check the lamp</li> <li>Check connection</li> <li>Connect lamp exit wire from interface board. If the lamp is lit, replace the board.</li> </ol> <ol style="list-style-type: none"> <li>Check fuse F3 on the feeder (15 AMP)</li> <li>Check for +7.5 VRM voltage on the feeder.</li> <li>Replace interface board.</li> <li>Replace connecting cable CPU interface</li> <li>Replace CPU board.</li> </ol>
ALWAYS ON	NORMAL		<ol style="list-style-type: none"> <li>Check connections to find short circuits.</li> <li>Replace interface board.</li> </ol> <ol style="list-style-type: none"> <li>Replace interface board.</li> <li>Replace connecting cable CPU interface.</li> <li>Replace CPU board.</li> </ol>
GLOWS DIM		<ol style="list-style-type: none"> <li>Check for 7.5 Vac on feeder.</li> <li>Check for mains voltage and transformer connection.</li> </ol>	<ol style="list-style-type: none"> <li>Check for + 7.5 VRM voltage</li> <li>Check for mains voltage and connection of the transformer.</li> </ol>

**DISPLAY: (insert test number 02)**

POSITION	ONE DISPLAY	ALL DISPLAYS
OFF	<ol style="list-style-type: none"> <li>1. Check connections and flat-cable connections.</li> <li>2. Check for + 5 Vdc + 170 Vdc on display board.</li> <li>3. Replace display.</li> </ol>	<ol style="list-style-type: none"> <li>1. Check for + 5Vdc + 170 Vdc on the feeder.</li> <li>2. Check for fuse F3.</li> <li>3. Check for + 5Vdc on the interface board.</li> <li>4. Replace the interface board.</li> </ol>
INCORRECT DISPLAYS	<ol style="list-style-type: none"> <li>1. Check connections and flat-cable connections.</li> <li>2. Replace display.</li> </ol>	<ol style="list-style-type: none"> <li>1. Check connections of the CPU board output flat-cable.</li> <li>2. Check if the problem remains also with the interface removed from the CPU board.</li> <li>3. If YES replace CPU board, if NO replace the interface board.</li> </ol>
GLOWS DIM OR EXCESSIVE	<ol style="list-style-type: none"> <li>1. Check for + 170 Vdc on feeder and if it is not possible to adjust it, replace the feeder board.</li> </ol>	

**SOLENOIDS (insert test n° 05)**

POSITION	ONE OR MORE	ALL
NEVER ACTUATED	<ol style="list-style-type: none"> <li>1. Check connection.</li> <li>2. Check fuse 2 A under playfield.</li> <li>3. If broken solenoid is the Knocker, check fuse from 1A in the cabinet near the knocker.</li> <li>4. Check fuse F2 on the feeder (5 AMP).</li> <li>5. Check for +39 VRM voltage on the feeder.</li> <li>6. Check for 43 Vac voltage on CN1 connector of the feeder.</li> <li>7. Ground for 1 second the output interface board solenoid. If solenoid is activated replace the board.</li> </ol>	<ol style="list-style-type: none"> <li>1. Check fuse F2 on the feeder (5 AMP)</li> <li>2. Check for +39 VRM on the feeder.</li> <li>3. Check for 43 Vac voltage on connector CN1 of the feeder.</li> <li>4. Replace the interface board.</li> </ol>
ALWAYS ACTUATED	<ol style="list-style-type: none"> <li>1. Check connections to single out possible short circuits.</li> <li>2. Replace the interface board.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace the CPU board.</li> <li>2. Replace the interface board.</li> </ol>
INSUFFICIENTLY ACTIVATED	<ol style="list-style-type: none"> <li>1. Check connections.</li> <li>2. Ground for a moment the output wire of the interface board. If the solenoid is regularly activated, replace the board.</li> </ol>	<ol style="list-style-type: none"> <li>1. Check for +39 VRM on the feeder.</li> <li>2. Check for 43 Vac voltage on the feeder connector.</li> <li>3. Replace the feeder.</li> </ol>

**CONTACTS (insert test 03)**

POSITION	ONE OR MORE CONTACTS	ALL CONTACTS
INOPERATIVE	<p>1. Check that the contact is normally open (be careful when contacts are in parallel).</p> <p>2. Check operation by directly bridge connecting the input wires on the contact.</p> <p>If in this way the contact is activated, replace the diode.</p> <p>If the contact is not yet activated, check the connection up to connectors CN8 or CN9.</p> <p>3. Insulate the contact wires and make sure that there are no short circuits with other wires.</p> <p>4. Replace CPU board.</p>	1. Replace CPU board.
