CHALLENGER

CHALLENGER is the newest video game to be introduced by Centuri. With its vivid colors and lively setting, it is sure to lure the most ardent player into game action.

The game consists of sixteen sectors(rounds) of play. Sector one begins with Large Energy Rings floating randomly across the screen. The Spaceship must avoid colliding with the Rings, or it will explode into a starburst of brilliant colors. The Spaceship dodges the Energy Rings by moving right or left across the playfield, while bursting them with the Spaceship's 3-directional guns. Bursting the Large Rings(100 points), breaks them into Medium Rings. Bursting the Medium Rings(200 points), breaks them into Small Rings. Bursting the Small Rings(400 points), causes them to disintegrate.

The Spaceship is further protected by a feature called a "Warp" button. By depressing this button, the Spaceship will relocate from the top or bottom of the screen to the opposite side.

If the Spaceship is in ultimate danger of being destroyed, releasing its Super Bomb will wipe out all the objects on the playfield, and add the point value of the objects to your score. Use of the Super Bomb is lost, if the ship is destroyed first. Only one Super Bomb is awarded per Spaceship.

At any time, a colorful Space Bogey resembling a Worm may appear on screen and proceed to chase the Spaceship. If the Worm is destroyed by Spaceship fire, or dodged successfully for several seconds, a "clang" is heard and the Worm(500 points) wriggles off the screen in a bright red hue of embarrassment. If the Spaceship is caught by the Worm, a bell is sounded, and the astronaut is chased out of his ship in pursuit of safety.

At random time intervals a Bonus Bug will walk across the playfield, stop, and count down a Bonus Number. This number is equal to 100 times its value. To receive this Bonus, the Spaceship must link with the nose of the Bonus Bug.

When the Spaceship has survived 50 Seconds of playing time, it now enters the challenges of the next sector.

The remaining 15 sectors are played in the same manner as Sector one. The differences include that each succeeding sector increases in difficulty. The Energy Rings increase in number and move faster across the screen making them harder to dodge. Also there are several Space Bogeys introduced in the first 8 sectors. They also increase in number with advancement through each sector. Some of the Space Bogeys resemble Comets whizzing through space. Others resemble Spaceships from other worlds. Each Space Bogey(500 points), is an assemblage of bright colors, and when destroyed, burst with a "clang" into a spray of bright light.

Sectors 4, 8, 12, and 16, are alike as follows. A few seconds after the Energy Rings are broken into smaller pieces, they are pulled into a Black Hole in the center of the screen. While swirling across the game area, the condensed Rings expand and shatter into fragments which must be destroyed before they absorb the Spaceship.

When Sector 16 has been accomplished, it will return to Sector 9.

When Bonus levels are achieved, an additional Ship will be added to your game.

CHALLENGER INSTRUCTIONS

1. BURST ENERGY RINGS TO SCORE AND INCREASE BONUS LEVELS.
LARGE RINGS - 100 POINTS
MEDIUM RINGS - 200 POINTS
SMALL RINGS - 400 POINTS
2. AFTER ALL THE SMALL RINGS ARE HIT, ADVANCE TO THE NEXT SECTOR.
3. IN EACH SECTOR, SPACE BOGEYS APPEAR AND SCORE 500 POINTS WHEN HIT.
4. WHEN THE BONUS BUG WALKS ACROSS THE PLAYFIELD AND STOPS, BONUS POINTS ARE COUNTED DOWN. TO COLLECT THE BONUS, LINK THE SHIP WITH NOSE OF THE BUG.
5. PRESSING THE WARP BUTTON IMMEDIATELY RELOCATES THE SHIP FROM THE TOP OR BOTTOM OF THE PLAYFIELD TO THE OPPOSITE SIDE.
6. THE SUPER BOMB BUTTON DESTROYS ALL OBJECTS ON THE PLAYFIELD SCREEN AND AWARDS TOTAL POINT VALUE TO YOUR SCORE.
7. ONE SUPER BOMB IS AWARDED PER SHIP. USE OF IT WILL BE LOST IF THE SHIP IS DESTROYED FIRST.
8. GAME IS OVER WHEN ALL THE SHIPS HAVE BEEN DESTROYED.

OPTIONAL SWITCH SETTINGS

The optional switch settings for the game are found on the C.P.U. Board. They will aid you in your game selection format.

Dip Switch A controls the number of coins per game, and also the the number of ships allotted per game. The following settings can also be found described on mode 6 of the self diagnostic test modes. (See System Diagnostics section for further explanation.)

DIP SWITCH A

Switches 1 and 2, of this switch, control the number of coins per game:

<u>SWITCH 1</u>	<u>SWITCH 2</u>	<u>COINS PER GAME</u>
Off	Off	1 Coin per game
On	Off	2 Coins per 1 game <u>or</u>
		3 Coins per 2 games
Off	On	2 Coins per game
On	On	Free Play

Switches 3 through 6 are factory settings. They are to remain in the OFF position.

Switches 7 & 8 control the number of ships allotted per game:

<u>SWITCH 7</u>	<u>SWITCH 8</u>	<u>NO. OF SHIPS PER GAME</u>
Off	Off	3
On	Off	4
Off	On	5
On	On	6

Dip Switch B controls the number of points at which a Bonus Ship is awarded, as well as some factory settings also described on mode six of the self diagnostic test modes.

DIP SWITCH B

Switches 1 through 3 control the Bonus Ship for different point levels.

<u>SWITCH 1</u>	<u>SWITCH 2</u>	<u>SWITCH 3</u>	<u>BONUS SHIP AWARDED AT</u>
On	On	On	30,000 Points
Off	Off	Off	40,000 Points
On	Off	Off	50,000 Points
Off	On	Off	60,000 Points
On	On	Off	70,000 Points
Off	Off	On	80,000 Points
On	Off	On	90,000 Points

Switches 4 & 5 are factory settings and remain in the OFF position.
Switches 6 & 7 are factory settings which remain in the ON position.
Switch 8 - OFF for the upright game; ON for the Cocktail Table.

SYSTEMS DIAGNOSTICS

Programmed into the Challenger game is a feature called "Systems Diagnostics". This is a series of system level (game level as opposed to circuit level) tests which are used to aid a service operator in checking-out or setting-up a game on site. Regardless of the state of the game or position of the operator switch settings, entry into the test modes is possible as long as the power is on in the game. This is accomplished by depressing the test switch located on the inside of the coin door. By pressing this switch down, a momentary action results which advances you through the selection of test modes. By pressing the switch up, it is now placed in a detent position. This position is used in performing special tests within some of the modes. To exit from the test modes, activate the coin-switch or slam-switch, upon which the game automatically returns to the attract mode. Please note that test mode 7 is used to test the coin switches and exit from it can only be accomplished by stepping to another test mode or interrupting the power with the switch in a neutral position.

The test modes are numbered 0 through 9, with Mode 0 displaying the "diagnostic menu". This is merely the Table of Contents of all of the test modes. The following is a brief description of each of the nine mode selections:

COLOR FIELDS (Mode 1)

This test is comprised of a built-in, color bar generator. It is used to properly set-up the color monitor for color purity, static and dynamic convergence, and white balance. When Mode 1 is first entered the screen is all black with "TEST NO. 1 COLOR FIELDS" inscribed across the top. When the test switch is placed in a detent position (upward), the screen will automatically sequence cyclically through the 8 color fields (solid color rasters) of RED, GREEN, YELLOW (RED & GREEN), BLUE, MAGENTA (RED & BLUE), CYAN (GREEN & BLUE), WHITE (ALL ON), BLACK (ALL OFF). Any of these color fields can be selected by returning the test switch to a neutral position.

COLOR GRIDS (MODE 2)

This test displays crosshatch patterns. As in Mode 1, the switch in a detent position can be used to select any of the eight colors. The color grids fill the total image display on the monitor screen, so that size and position adjustments of the grid relate directly to the game image. These grids should be periodically used to check the monitor set-up for IMAGE SIZE, POSITION, SYNCHRONIZATION, LINEARITY, PINCUSHIONING, COLOR CONVERGEANCE, COLOR BALANCE. Image focus and brightness should be a final adjustment made on-site to the game, while in play.

CONTINUOUS VIDEO CLEAR (MODE 3)

The function of this test is to provide repetitive clear and write signals, so that the functions can be observed with synchronous test equipment such as oscilloscopes. When Mode 3 is entered, the

screen will go solid blue with "TEST NO. 3 CONT". VIDEO CLEAR" displayed across the top in black. After a 2 second delay, the screen will begin flashing, indicating that repetitive "clear to blue" signals are being processed.

CONTINUOUS VIDEO WRITE (MODE 4)

When the test in this mode is entered, the monitor screen will be cleared to all black and "TEST NO. 4 CONT. VIDEO WRITE" will be displayed across the top of the screen in white. After a 2 second delay, a white diagonal line will appear from the upper-left to the lower-right screen. Although not apparent to the viewer, this line is being constantly redrawn to force the video X-Y write counters to cycle through binary up-counts.

Since the video RAMS are being continuously accessed, errors from defective or marginal RAMS will appear as spurious dots on the screen, and when errors are observed, the next test mode can then be entered to determine which RAMS are generating the erroneous dots.

VIDEO RAM LOCATOR (MODE 5)

Mode 5 is a unique diagnostic aid that uses the video display as well as the hardware configuration of the video computer to isolate problems down to chip level. There are 48 video RAM chips which are socketed and arranged in three groups of 16, corresponding to the 3 primary colors: Red, Green, and Blue. Whenever one of these chips is defective, spurious dots will appear on the screen.

For this test, vertical, white lines are spaced across the screen, and 3 pairs of letter-numbers appear in the middle of the screen. These pairs are "road-map" locators corresponding to the physical location of the 3 specific RAM chips on the video board. The locators are displayed in Blue, Green, and Red, and correspond to the 3 RAMS which generate the vertical white lines. If any of the white lines overlaps a noise dot, the locator indicates which chip generated that dot.

By moving the test switch up and then back to neutral immediately, the next set of RAMS is selected. The vertical lines appear wider since a second set of lines is drawn adjacent to the first set, and the RAM locators change to indicate the new set of RAMS which generate the new lines. Once again, if these white lines overlap a noise dot, then the locator will tell you which chip is generating that dot.

Activating the test switch to the detent position (upward), then back again to neutral can be repeated 16 times total. This process continues adding white lines to the screen until the entire image area is covered with white lines. It is helpful to experiment with this test by removing one of the RAM chips and find its location by using the video locator.

DIP SWITCHES (MODE 6)

Test Mode 6 serves a dual, first by checking the proper operation of the option DIP switches(A & B), and second by displaying all the possible switch options. The DIP switch positions are numbered and followed by the word OFF in Red. When a switch is turned ON, it will be written in Green, following the switch number. The best way

to verify proper operation of the DIP switches is as follows:

1. Turn all switches OFF.
2. Confirm all 16 OFF is displayed.
3. Turn all odd-numbered switches ON.
4. Confirm alternating ON-OFF is displayed.
5. Turn all remaining switches ON.
6. Confirm all 16 ON is displayed.
7. Turn all odd-numbered switches OFF.
8. Confirm alternating OFF-ON is displayed.
9. Turn all switches OFF.
10. Confirm return to all 16 OFF.

For various selections of the switch options, see the OPTIONAL SWITCH SETTINGS section of this manual.

COIN & START SWITCHES (MODE 7)

In this display, as in the previous test, the switches are numbered and followed by word OFF (in Red) or ON (in Green) when the switch is activated. There is also an additional column labeled LOCATOR, which provides the information concerning the connection of each switch to its harness. FOR EXAMPLE ONLY: If the SLAM switch locator is A30J1-4, this means that this switch is wired to Pin 4 of Connector J1 on assembly A30. When the SLAM switch is activated, the display should show COIN-DOOR switch number 3 ON. If it doesn't connect a jumper from the common of the connector to Pin 4. If the display shows ON, the problem is external to the computer system.

Each of the switches listed in this test display should be manually activated to verify proper electrical connections. However, most of these switches are critical switches, and the only true test of total operational performance is by actual use in a game environment. FOR EXAMPLE, multiple coins should be inserted in the coin-slot with the verification of proper tracking of the coins all the way to cash box, through proper credit accumulation and coin counting. Note that the SELECT TEST switch cannot be directly tested in this mode since its activation will sequence to the next test mode.

PLAYER SWITCHES (MODE 8)

The display format for this test is identical to test 7, except that it displays the player 1 and player 2 control switches. This test is also used to isolate problems, but performance testing must be obtained by operating the switches while playing an actual game.

AUDIO COMPUTER (MODE 9)

This test lists all the 15 sounds in the Challenger game. By putting the switch in the detent position (up), a sequence of sound effects will be heard. If the proper response is received by the Game Computer, the test will display OK in Green after the sound number. If not, it will write NO in Red. Either response indicates that the request was made. Thus this test provides a check on the Game-to Audio Computer link, when the sound system is not working or not properly connected.

INSTALLATION

Your game was shipped from the factory in ready-to-play condition. A brief inspection is suggested before the machine is removed from the carton. If there is damage to the shipping carton, contact the freight carrier for claim purposes. External damage could indicate possible damage to the cabinet and/or electronics components.

After the carton has been satisfactorily inspected, remove the machine from the shipping carton.

Examine the interior of the game for disconnected wires, cables, or harnesses. Make sure the electronic devices are securely mounted in their sockets, etc. Record the game serial number since it will be required for reference and servicing.

ELECTRICAL REQUIREMENTS

Unless otherwise specified, this game is set to operate at 110 Volts A.C. See Figure-2- and 110/220 VAC conversion instructions.

Power Supply Chasis schematic information and parts list are included in this manual.

ROUTINE MAINTENANCE & SERVICE

Because of the solid state electronic circuitry, this machine should require very little maintenance and only occasional adjustments. However, it is necessary to take measures to insure this.

The volume control is labeled, and located in the middle of the cabinet, and can be accessed through the rear cabinet door.

The video monitor has been properly adjusted before shipping. Occasionally minor adjustments are necessary. See monitor specifications and schematics for technical information. Adjustment controls for the monitor are located on the rear of the monitor.

This machine should be serviced only by a qualified technician.

Do not make any adjustments on this machine while power is on.

For service information, contact the Customer Service Department. The number and information is located on the first page of this manual.

POWER SUPPLY

The Computer Board in this game operates most efficiently and reliably when the power supply is set so that the voltage on the board is 5.0 Volts, ± 0.1 Volts. To check this, place a meter across the 5 Volts and ground at the edge of the connector. If necessary, adjust the screwdriver control on the power supply so the meter reads between 4.9 and 5.1 Volts.

110/220 VAC CONVERSION INSTRUCTIONS

This video game has a harness configuration that allows the machine to be operated from either a 110 VAC or 220 VAC, 50 or 60 Hz power source. All games shipped from Centuri, Inc., are in the 110 VAC configuration. To change to the 220 VAC configuration perform the following:

- FIRST: Unplug the machine from the wall outlet to completely eliminate shock hazards.
- SECOND: Remove the single 3 AMP slow-blow fuse in the A.C. Distribution Bracket, and install two(2) 1.5 AMP slow-blow fuses. Now cut the #18 AWG. white jumper wire at both ends of the fuse holder and replace the cover.
- THIRD: Locate the "orange" jumper plug marked 110 VAC on the game power transformer, on the floor of the machine. Unplug the "orange" jumper, and plug in the "red" jumper plug marked 220 VAC.

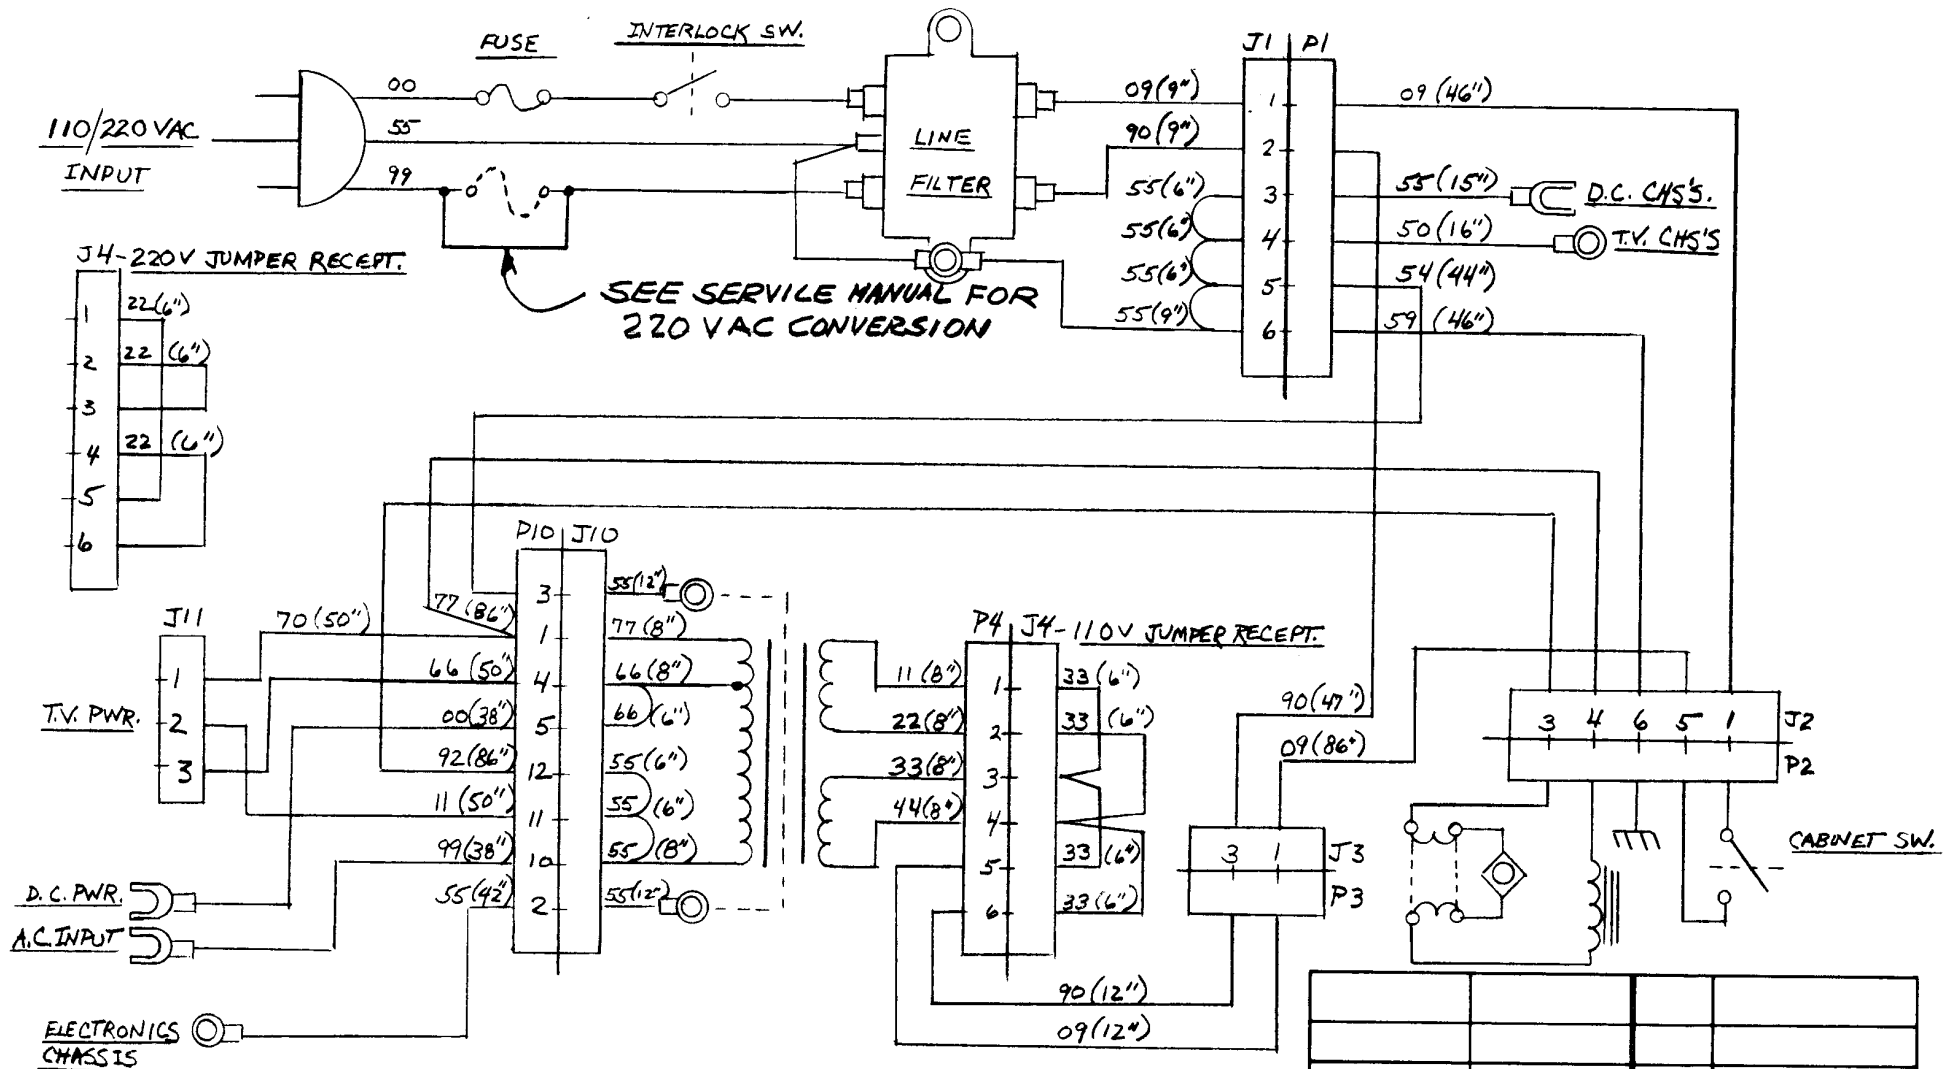

To change back to 110 VAC, replace the components changed in Steps above.

- *NOTE: The common side of the A.C. Line must not be fused in the 110 VAC configuration - Replace the #18 AWG., white jumper wire.
