introduction

This is an electronic game that makes extensive use of digital integrated circuitry and television monitor circuitry. This manual assumes the maintenance technician possesses a general knowledge of solid state circuitry, microprocessor, TTL digital integrated circuitry and T.V. monitor concepts. Any individual **not** knowledgeable in these areas **should not** attempt repair of the electronic portion of this game. It **should be noted that any attempt to repair the game in the field without the express consent of the factory will immediately void the warranty!!!**

important notes

An important service note is posted in this game and is repeated here for emphasis:

If at any time the T.V. screen shows a meaningless display or the game otherwise malfunctions, simply drop a coin into the coin mechanism. This should correct the problem. If not, the game requires service.

The circuitry in this game has been arranged so that the insertion of a quarter through the coin mechanism will reset the restart in the system. This clears up temporary problems caused by power line disturbances, static, etc.

SERVICE TECHNICIAN NOTE:

The system reset circuitry described above requires that the coin counter is attached to the system. If there is a coin counter problem and no replacement is available, the game will function properly if a 10K Ohm resistor is connected across the coin counter input pins to the video logic board.

also

Never replace any components with anything other than exact replacement parts. (See Parts list located on Service Schematics.)

Never remove circuit board connections while power is on.

Do Not replace the fuse with anything other than the proper value. A blown fuse indicates an overload condition within the game. Replacing the fuse with a higher value can cause severe damage to internal components if an overload occurs.

Always consult the manual before attempting repairs.

Correspondence regarding this game should be addressed to:

GREMLIN/SEGA
8401 Aero Drive
San Diego, California 92123
(714) 277-8700

game concept

Gremlin/Sega "MOON CRESTA" is a one or two player game in which players may compete for highest score against the game computer. Each time a player is hit by an alien, the game switches to his opponent's sequence.

The object is to destroy as many of the descending aliens as possible. To accomplish this, the player is given a three stage multi-fire Warship. He begins with the first stage, firing a single laser at the enemy. If he is successful in eliminating the first four sets of aliens, he is given an opportunity to dock his first stage onto the second within a specific time limit (the sooner he unites the stages, the higher is his awarded score).

Once docked, the stages combine their firing power, so the first (one laser) adds to the second (two lasers) giving the player a total of three usable lasers as the game continues.

The player then must face two more sets of aliens and a shower of meteors, after which he has a chance to dock again, this time uniting with the third stage for a combined fire power of five lasers. If he is able to defeat the last two sets of aliens intact, the entire sequence begins again. The game continues with increasing difficulty until the entire warship is destroyed. When the warship is hit the layer continues with whatever stages remain. If his score reaches 30,000 he is awarded a free game and his score continues to accumulate.

options selection

Your **Moon Cresta** game is equipped with a set of switches that allows you to determine the charge per play. The switches are located in the upper left corner of the logic board.

Coinage	Switch Position					
	1	2	3	4	5	6
1 coin/1 play			off	off		
2 coin/1 play			on	off		
3 coin/1 play			off	on		
4 coin/1 play			on	on		

Switch adjustments **must** be done with the power off. Switches are set at 1 coin/1 play when machine is shipped.

transformer voltage conversion instructions

To convert the game transformer to 100, 115, or 230 VAC, refer to the following chart:

For 100 volts: Connect the voltage *INPUT* lines to transformer terminals 1 and 2.

For 115 volts: Connect the voltage *INPUT* lines to transformer terminals 1 and 3.

For 230 volts: Connect the voltage *INPUT* lines to transformer terminals 1 and 4. The fluorescent lamp line must be connected to transformer terminal 3.

ALSO, THE TV MONITOR MUST BE CONVERTED TO THE SAME VOLTAGE INPUT AS THE GAME TRANSFORMER. REFER TO THE MONITOR MANUAL IN THE GAME.

repackaging instructions

Should it be necessary to ship this game, follow the instructions below for game recrating:

- A) If the original shipping bolts have been discarded (Ref. 1), obtain four 5/16-18 x 1 3/4" hex head bolts with 5/16" flat washers. Carefully lay the game on its side and attach skid (Ref. 2).
- B) Place game upright. Tape game keys to upper flange of operator's panel (Ref. 3). Crate the game using appropriate shock-absorbent packing material (Ref. 4). Include padding on all four corners of the game (Ref.. 5). After crating is completed, secure package with strapping (Ref. 6).

NOTE: If the game is to be shipped to GREMLIN for service or repair, attach a tag identifying the distributor and indicate the service or repair to be made; include the full serial number of the game. **GAME MUST BE SHIPPED PREPAID.**

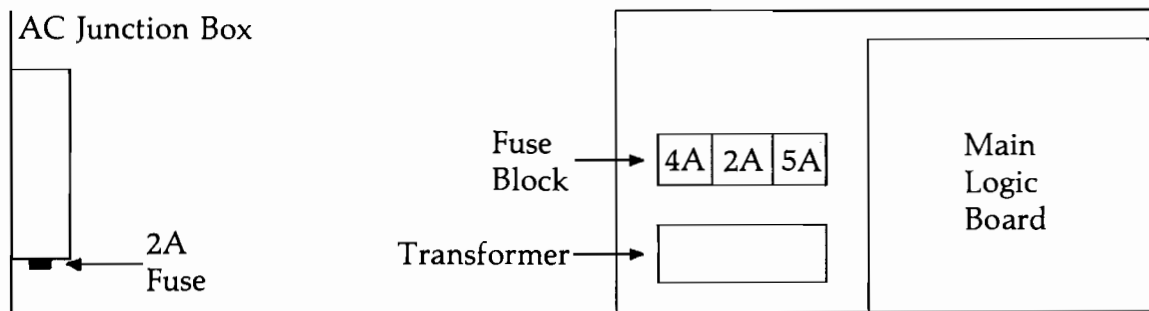

maintenance and troubleshooting procedures

Always check and confirm the following items when it is believed that a problem has developed. These items are relatively simple but commonly overlooked.

1. Is the power switch on?
2. Are all fuses intact?

One fuse is located directly on the bottom of the AC junction box and three others are located in a fuse block directly behind the transformer and to the left of the logic board when looking in from the rear. If a fuse blows out after being replaced, it indicates trouble in another component. **Always** replace with the prescribed capacity fuse, as normal equipment may be damaged if larger fuses are used as a substitute.

3. Are the connectors firmly inserted?
Poor connector connections must be considered for any indication of trouble. Check all related connectors for poor contact. Although disconnected connectors are easily spotted, poor contacts are difficult to locate. The connectors should therefore be pushed in firmly and then loosened to spot poor connections. When testing the PC board connectors, **always** turn off the power.
4. Turn power supply off and on again.
As the unit may return to normal if the control circuit is reset when the game seems abnormal, turn the power off and on to see if the trouble will clear up.
5. Are there any metallic objects on the PC board?
Ensure that there are no metallic objects on the PC board, as this will cause shorts in the system. Also refrain from putting other objects inside the cabinet.
6. Ensure that all eproms are firmly seated in the logic board.

The following instructions will help you trace down and find most problems. The procedures are listed by the more common kinds of problems that could arise. Read through all the steps first, then implement them one at a time. You will need an AC/DC voltmeter and an oscilloscope.

NO PICTURE—TV TUBE AND FLUORESCENT LAMP ARE OFF.

1. Plug the game in and check to see that it is receiving 115 (230) VAC. Measure 115 VAC at the input terminals of the game transformer. If it is not present, proceed to next step.
2. Check fuse located on the bottom of the AC junction box. If it is good, proceed to next step.
3. Remove the cover of the junction box. Measure 115 VAC on the output of the EMI filter. If it is not present, the EMI filter may be bad or one of the AC line connections in the junction box may be loose. **Unplug** the game and re-check these connections.
4. If the fluorescent lamp still does not operate, turn the game off and then turn it on again. This usually re-starts the lamp. If it doesn't, turn the lamp in its socket. This will re-seat it for a better connection. Sometimes the lamp works loose during shipment.

NO PICTURE—TV TUBE AND FLUORESCENT LAMP ARE ON. SCREEN BLACK

1. First make a quick check of the monitor-to-logic board connections. Are all wires making contact with the pin connector? Are the wires secure on the monitor plug-in connector?
2. Check 5C, 6F and 6H on the main logic board for proper video timing signals.

SCRAMBLED PICTURE OR LOSS OF VERTICAL OR HORIZONTAL HOLD.

1. Check sub board A and sub board B to ensure that they are properly seated. If they are loose or ajar, it will cause a scrambled picture.
2. Check the wires on the 6H modification to ensure they are not broken. Bottom wire controls vertical synchronization and top wire controls horizontal synchronization. Refer to drawing 800-3110.

SOUND PROBLEM OR NO SOUND.

1. Check wires running from VR to edge connector to ensure they are intact.
2. If they are not broken then check 11A.

INCORRECT POWER SUPPLY

1. Check D4, D5, IRI and IRII. Replace if necessary. All voltage is at +5V except 10L and 11A which uses 7V DC.

GAME DOES NOT COIN UP.

1. A common problem with a game that does not coin up is that the coin switch trip wire is out of adjustment. Usually, all that is necessary is to bend the trip wire up or down, depending on whether a heavier or lighter tension is needed.
2. Don't overlook the possibility of an incorrect or faulty coin switch-to-logic board connection. Sometimes these wires work loose from the coin switches.
3. Check main logic board—resistor packs 1 or 2 may be bad and need to be replaced. Also Check 9E.

PLAYER CONTROLS NOT WORKING.

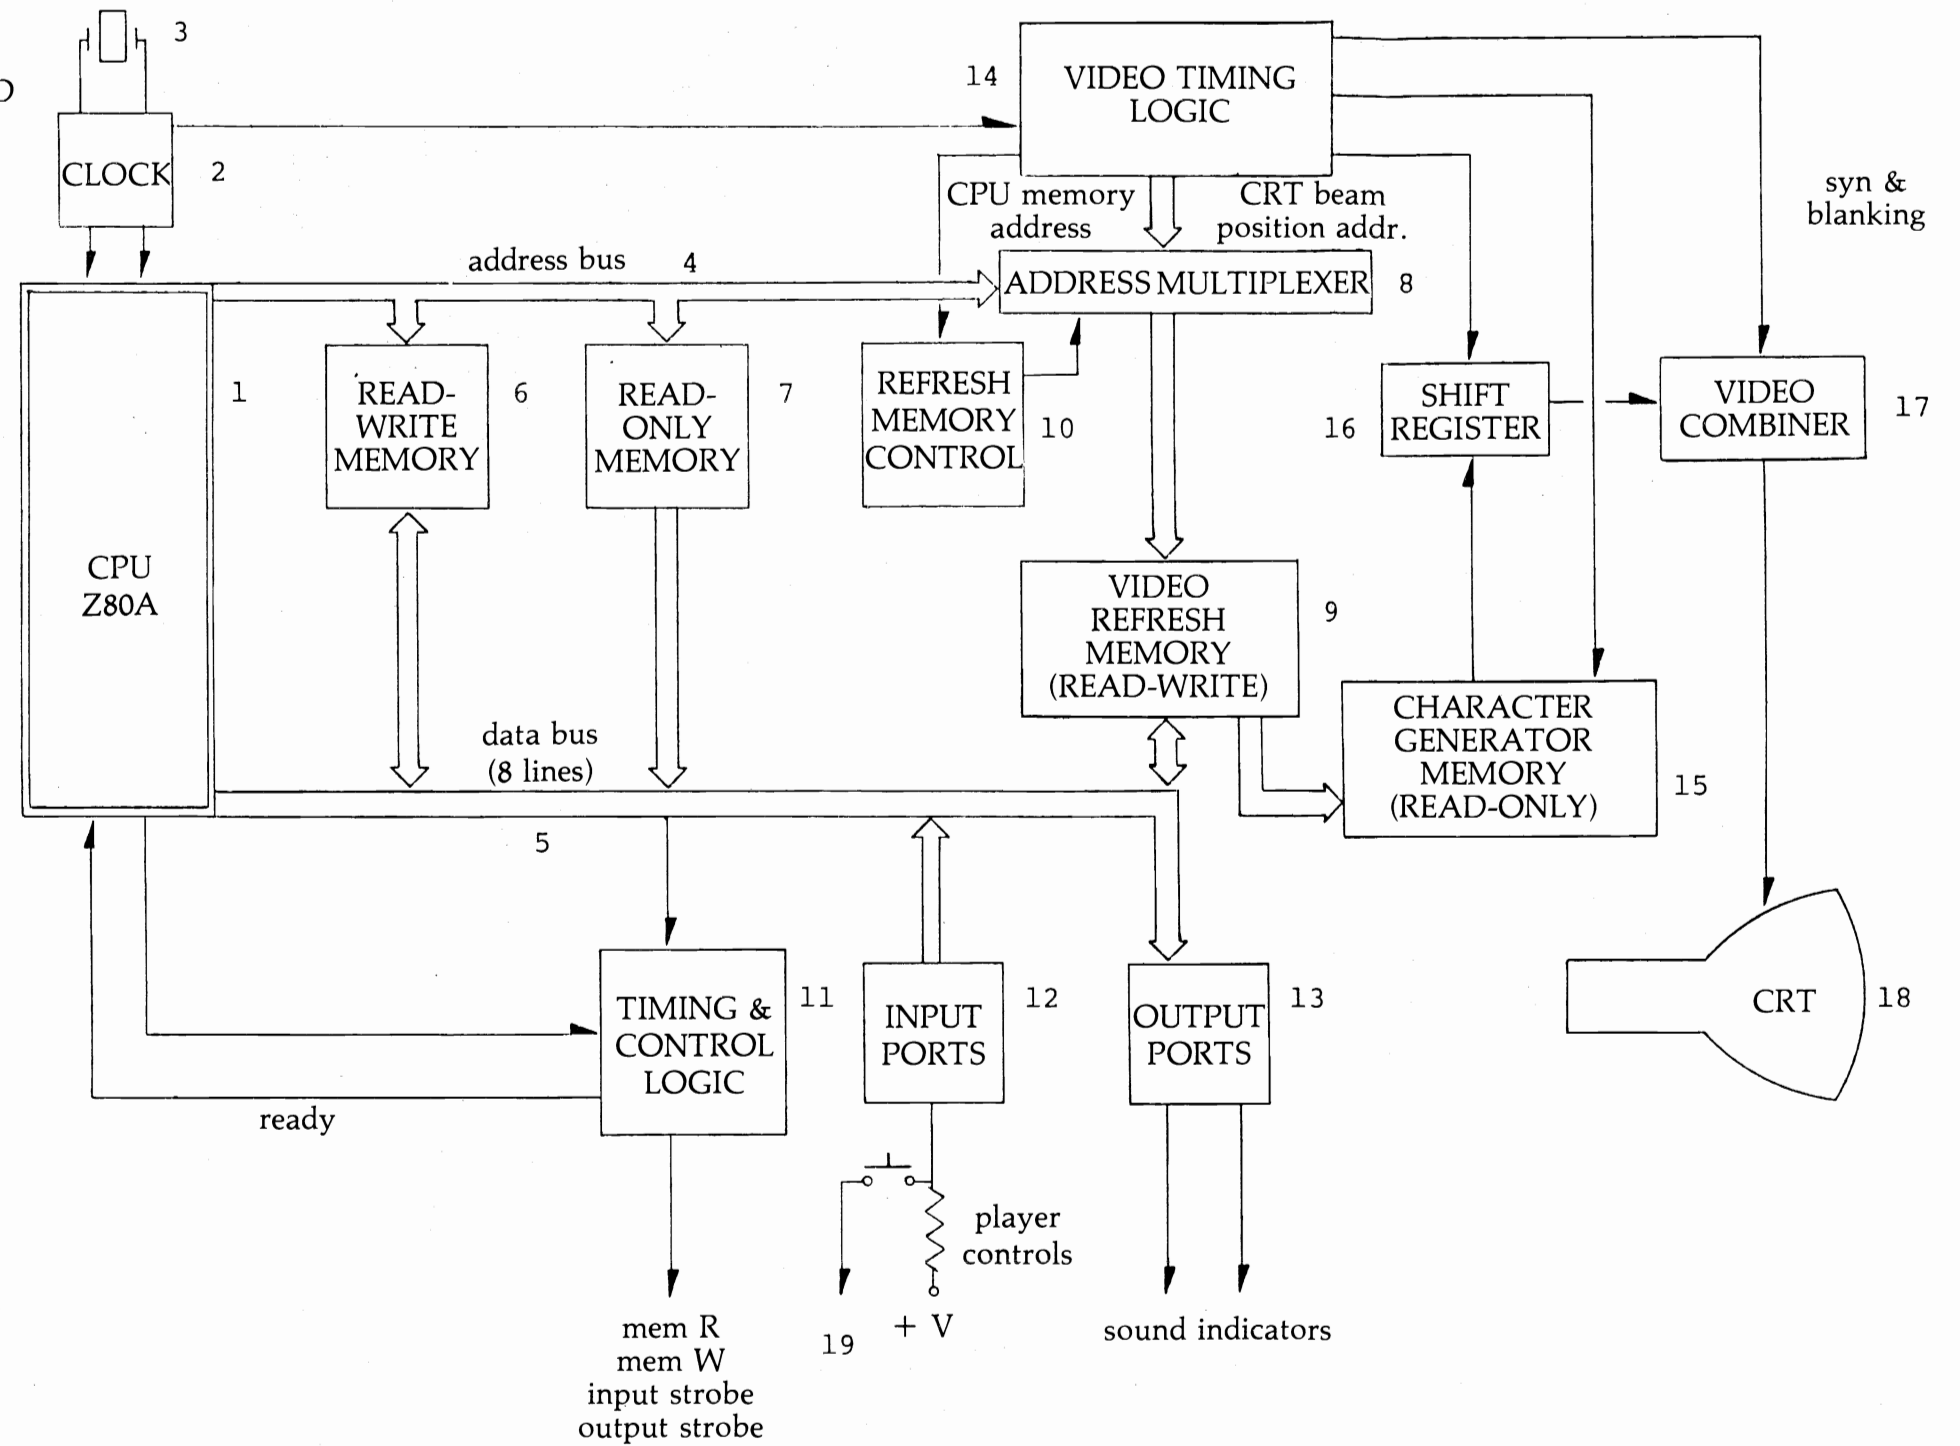

1. Check first to be sure all control switch connections are secure. This includes checking the black ground wire leads.
2. If these connections are good, make sure the control panel leads are intact inside the connector to the logic board.
3. Check the main logic board—the 3 jumpers illustrated in detail B of drawing 800-3110 may have broken loose. Also check 9E.

WE WELCOME YOUR COMMENTS!

Your comments and suggestions will assist us in improving the usefulness of our publications. They are an integral part of preparing for revisions of manuals and parts catalogs.

If you have any technical questions about any GREMLIN/SEGA game, are requesting additional publications, or have a suggestion about how we can make our manuals more useful to you, drop us a line or use the handy form below. We value your input.
